**The Federal Project.**—Most noteworthy of the Federal achievements was the completion of a varied group of sculptures for the new United States Post Office building in Washington through assignments and competitions given by the Procurement division of the Treasury Department, Section of Painting and Sculpture. Two of the major details were large size statues in marble designed for the reception room of the postmaster general's office—one of Benjamin Franklin, to commemorate his services as pioneer head of the postal system in the American colonies, the other of Samuel Osgood, first postmaster general of the United States. The Franklin statue was made by William Zorach, and that of Osgood by Paul Manship.

The Federal project called for other sculptural details, including 12 smaller statues in aluminum for the same setting. Statues of postmen of different periods in the nation's history were produced by as many artists assigned for the work following a competition in which many sculptors participated. Another important development was the completion of major sculptural work for the new National Archives building. This was chiefly in the hands of three prominent sculptors. Robert Aitken completed two large allegorical figures for the sides of the Pennsylvania avenue entrance, symbolizing "The Past" and "The Present." The pediments were treated by Adolph A. Weinman and by James Earle Fraser.

"THE BRIDE," a terra cotta by Alexander Archipenko, Seattle, Washington, Museum

While sculptors continued to win recognition for their talents with independent creative work, much of which was presented in exhibitions, others found their chief rewards in public monuments and memorials. Royal Cortissoz, art critic, commended as "extraordinarily life-like and convincing" an impressive frieze of 68 portraits by Mr. Aitken of the world's great painters, sculptors, and architects; this frieze was erected in two 50ft. panels at either side of the main entrance of the Columbus (Ohio) Gallery of Fine Arts. It was begun in 1930, brought to completion in 1937, and is known as the Frederick W. Schumacher Frieze, from the name of the donor whose gifts made possible the erection of the gallery.

The principal addition to sculptural monuments on Fifth avenue, New York, was the gigantic stylized figure of Atlas bearing a massive armillary sphere, designed by Lee Lawrie, and installed at the entrance to the International building at Rockefeller Center. In the field of memorial sculpture, a notable achievement was the completion of a heroic equestrian statue of General Anthony Wayne, a hero of the American War of Independence, by John Gregory. This was erected during the year

Paulanship's STATUE OF SAMUEL OSGOOD, first U.S. Postmaster General, in the Post Office Department building, Washington, D.C.

in front of the Pennsylvania Museum of Art in Philadelphia. Workmen on the Mount Rushmore Memorial near Rapid City, S.D., continued to further the ambitious project there, which was begun several years ago, and is to present in bold relief the heads of Washington, Jefferson, Lincoln, and Theodore Roosevelt.

**New York World's Fair.**—Provision for the extensive use of decorative sculpture at the New York World's Fair gave a marked stimulus to the profession, and a number of important commissions were given. The program called for four 15ft. groups interpreting "Night" and "Day" and a 50ft. sundial symbolizing "Time" for the Fair's central Mall, by Paulanship, and a monumental 50ft. figure of George Washington by James Earle Fraser, as well as other allegorical groups. Much of the work was approved in sketch form before the close of the year, ready for enlargement by a host of assistant sculptors. Among the works completed was a 27ft. panel setting forth the Fair theme, "Vision of the Future," designed by Albert Stewart.

Memorable sculpture exhibitions added to the knowledge of early as well as contemporary sculptors. A large display of the work of William Rush, America's first sculptor of note, was held at the Pennsylvania Museum of Art. This consisted of carved allegorical figures and portrait busts collected from many sources in and around Philadelphia, and was valuable in bringing together his work for the first time. A memorial show of drawings and sculpture by Gaston Lachaise at the Whitney Museum of American Art extended further the public's appreciation of this artist's strongly individualized creative gifts. Another notable show was Malvina Hoffman's exhibition at the Virginia Museum of Fine Arts in Richmond, which introduced her work to the South, showing many of her portraits of racial types from the series in

the Hall of Man at the Field Museum in Chicago.

The year recorded progress through widespread accomplishments in sculpture, and saw an increased response of public interest through the activities of the Federal-sponsored regional projects in many localities.

**S.E.C.:** see PUBLIC UTILITIES.

**Secondary Education.** During the year 1937, and the period immediately preceding, secondary education reflected the changing conditions, fortunes, and philosophies of the nations of the world. In the capitalistic democracies it responded to the recovery of business and the improvement of economic circumstances; under the dictatorships it became ever more closely and effectually harnessed to the purposes of the state. But whereas under fascism formal secondary education languished, in the Soviet Union it advanced with rapid strides toward the distant but proclaimed goal of enrolling the entire adolescent population. In the war-torn countries of China and Spain it felt the full impact of military conflict, numbers of schools in the path of battle being destroyed and the remainder being affected in their work by the physical and moral concomitants of the struggle.

In the United States, far removed from the strains and fears of the Old World, secondary education, for the most part, proceeded along lines already well established. The public high school, having become the dominant institution of secondary education before the opening of the present century and representing in its origins a repudiation of the selective principle of European tradition, continued on the road toward a complete democratiza-

tion of its program. Its enrolment increased at approximately the expected rate, its articulation with the elementary school became closer, and the curriculum was adjusted more adequately to the greatly varying abilities, interests, and futures of its pupil population.

At the beginning of the school term in Sept. 1937, the U.S. Office of Education estimated the enrolment of the four-year high school at 6,500,000 boys and girls. This means that the phenomenal growth of secondary education since 1890, recorded in the virtual doubling of enrolments every ten years, was continued even in the period of depression. In 1937 the high school enrolled approximately 1,735,000 more students than in 1929-30. These figures also mean that about 65% of the total population aged 14-18 years are attending school. Wide differences among the States are, of course, still evident. Thus the above percentage ranges from close to 28.0% in Alabama and 33.5% in Arkansas to 90.8% in Washington and 95.6% in Utah. Since the country is tending rapidly toward a stationary population and since in a few States and in many localities almost all children of appropriate age are in high school, the rate of growth of this institution may be expected to decline in the years ahead. In fact such a decline is already discernible.

The problem of meeting the diverse needs of this vast adolescent population, recruited increasingly from all social strata and all levels of native endowment, continued to occupy the centre of attention throughout the year. This fact is clearly revealed by the report of the committee on orientation of the powerful and representative department of secondary-school principals. Under the chairmanship of Professor Thomas H. Briggs of Teachers College, Columbia University, this committee, after working for three years, issued its report in 1936. Among its major conclusions and recommendations, which formed the basis of widespread discussion in 1937, the following are worthy of mention: that a comprehensive program of secondary education, open to all normal individuals, be maintained at public expense; that a new educational agency be established to provide supervision and appropriate activities for young people whose needs are not met by existing institutions; that secondary schools assume the same responsibilities for the acquisition of desirable attitudes and ideals as for the mastery of organized knowledge; that secondary schools be freed from the traditional domination of colleges and universities and be permitted to devote their energies to the central task of meeting the needs of all pupils; that the curriculum be organized as far as possible in terms of the life activities in which pupils will engage; and that all youth be served through a curriculum differentiated in accordance with their needs and capacities. The report of this committee shows the general trend in responsible and even conservative thought in the field of American secondary education.

Perhaps the most significant fact regarding secondary education in the United States during the past several years has been the emergence of a "youth problem" of unprecedented proportions. The depression created a condition of economic instability which bears with particular severity upon young people in the years of late and post-adolescence. Approximately one-third of all unemployed persons are to be found in the 8-year age span from 16 to 24. Moreover, 40% of employable youth have been unable to find work. To meet this situation government has undertaken such special measures as the National Youth Administration and the Civilian Conservation Corps camps. Under the auspices of the American Council on Education the American Youth Commission, generously financed from private sources, has been organized to make a thorough and comprehensive study of the entire problem. The first reports of this Commission, appearing in 1937, suggest that the burden of caring for unemployed youth will

be placed increasingly upon the secondary schools of the nation. But whether these institutions assume this responsibility or not, the present social and economic maladjustment of youth will have a profound influence upon American secondary education. Such influence is already apparent. (*See EDUCATION.*) (G. S. Cs.)

**Great Britain.**—Existing secondary schools range from the maintained schools provided by the local authority, through the aided schools, to the independent and public schools. The distinction is largely one of finance and control. Some schools are controlled locally under the general oversight of the Board of Education; other schools—mainly the old endowed schools—have independent governing bodies, the work of which is again lightly controlled by the Board of Education; whilst other schools—generally boarding schools—are quite independent of public control. All these schools are co-partners in the great task of secondary education.

Most of the maintained schools take a high proportion of special place scholars, *i.e.* the entry is competitive and the fee depends on a means test applied to the parents.

There are one or two recent advances towards freedom which should be recorded. Modifications of the School Certificate Examination are being made which will largely free the schools from the incubus of matriculation. This is a great step forward. It enables the school to adjust the curriculum according to the interest and ability of the pupils rather than force them through the five-line groove which has been considered essential for the prospective undergraduate.

Again, Sixth Form work has been controlled by means of advanced courses, and grants were paid for such courses as satisfied the Board of Education. The restriction of courses and subjects has been removed, and schools may now arrange a perfectly free Sixth Form curriculum. Their freedom is limited still, however, by the requirements of University Scholarship Examinations.

Other changes can be summarized briefly. Physical training is receiving more and more recognition in the schools and the cinematograph and broadcasting are being tested to see what contribution they can make towards the educative processes. There has also been a general lightening of home-work, in the hope that more time will be given to leisure pursuits and hobbies. Lastly, secondary teachers themselves are taking a greater interest in professional training. Attempts are being made to evolve a system which will not only prepare teachers for secondary schools, but keep them in touch with the University Training Departments for the first years of their active teaching life. (T. TH.)

**Seeing Eye,** the corporate society that educates dogs to be the trusted guides and friends of blind men and women, has had in 1937 the most successful year since its inception in 1928 when Mr. Morris Frank brought his German shepherd, "Buddy," from Mrs. Harrison Eustis's kennels in Switzerland. Bred for "character" and trained by Mrs. Eustis and Mr. Elliott S. Humphrey, the geneticist, "Buddy" is the dog that proved Seeing Eye dogs could safely guide blind people through heavy American street traffic; and it is primarily due to her that in this year of 1937 one hundred dogs graduated from the Seeing Eye at Morristown, N.J., and led their one hundred blind owners from darkness and dependence into light and liberty.

Seeing Eye dogs are now working in forty of the forty-eight United States. Sixteen of them are "attending college" as pilots to student masters; others are engaged as guides in such diversified occupations as the law, the ministry, journalism, politics, music, and a great variety of mercantile pursuits, including the raising of poultry. In addition to the actual dogs produced this year for those blind persons capable of benefiting from a dog—for unhappily all blind men and women cannot be permitted to

hope for this liberation—the Seeing Eye has made notable progress in informing a sympathetic public not only of the Seeing Eye's need for financial support (each dog costs approximately \$900 of which the blind purchaser is asked to pay only \$150) but also of the truth about blindness.

An ancient and truly blind tradition has encouraged the pitying notion that blind people are not normal individuals but a helpless group of the afflicted. In breaking down this hampering attitude of mind the Seeing Eye graduates themselves—both the human and canine ones—are the chief missionaries. They are everywhere proving that a blind person with a Seeing Eye dog is not merely an amazing prodigy but is an ordinary member of society, somebody who is “like anybody else.” (B. TA.)

**Seismology** has continued to advance during the year though there have been no great earthquakes to spur interest. In fact, the low activity renders it unnecessary to list any of the earthquakes. Co-ordinated effort in many lands has made effective progress possible. The trend of development has been toward more complete information rather than toward spectacular discoveries. From the viewpoint of investigation of the earth's interior and crust, studies have included: improvement of tables of travel time of earthquake waves; discovery and listing of new phases; variation of travel time with direction of travel of the waves; and deep-focus earthquakes. Through seismic methods using explosions as source of waves, conditions beneath the sea have been studied and possibility of extension to great ocean depths has been indicated.

Strong earthquake motions have been measured and analyzed, the results tested for accuracy and application has been made to structural design. In regions of great structures, such as dams and bridges, special provision has been made for locating earthquakes and recording their destructive motions. In this connection, natural vibration periods of structures and of the ground have been measured. Little progress has been made in determining ultimate earthquake cause but light has been thrown on conditions within the crust by laboratory tests of crustal materials under high temperature and pressure. Though general earthquake prediction is regarded as impossible, attention has been given to the possibility of determining whether stress is growing in the crust which may lead to earthquake, by means of triangulation, levelling, tilt measurement, and special measurements along great fault planes. In Japan an effort has been made to relate chronic or long-continued slow tilt with acute tilt which occurs before earthquakes.

Information regarding earthquakes has been made more complete through additional instruments and through better systems of securing reports from individual observers. Conditions are still unsatisfactory, however, for much of the earth. Immediate location of important earthquakes has stimulated interest. The strongest attack on the problems has been made in Japan and the United States, covering both the scientific and practical sides of the problem.

In Europe special attention is given to scientific problems, though some work on practical applications is being done in Germany and Italy.

Under international auspices the preliminary list of earthquakes for the earth as a whole is published in France and the final list in Great Britain. An excellent bibliography is prepared by Canada. (N. H. H.)

**Serum Therapy.** The use of antitoxins, serums and vaccines for the prophylaxis and treatment of disease steadily advances. Such agents are employed in anthrax, bacillary dysentery, brucellosis, cholera, diphtheria, erysipelas, meningococcic meningitis, plague, pneumonia of certain types, rabies, scarlet fever, tetanus and typhoid and less commonly in tularaemia and botulism. Recent advances include the use of serum in the treatment of Types V, VII, VIII and XIV pneumonia with results which have been at least equal to those obtained in Types I and II pneumonia. Favourable effects have been obtained in the treatment of Types I, II, VII and VIII pneumonia by the use of an unconcentrated rabbit serum. Employed intravenously in smaller amounts these serums appear to be more effective than the older concentrated horse serums. Pertussis vaccines are being used routinely in Denmark for the prevention of whooping-cough with the hope of controlling the disease to the extent that smallpox, diphtheria, etc., are controlled, but experience in the United States does not suggest that there is any satisfactory agent for the prevention of whooping-cough. One-ninth of the subcutaneous dose of typhoid vaccine has been given intracutaneously and appeared to be equally effective when tested at the end of one year. There is still no satisfactory vaccine for the treatment of the “common cold,” influenza or chickenpox. The prophylaxis of the virus diseases smallpox and rabies has long been established, but no suitable immunization against poliomyelitis has been developed, although the experimental work has been extensive. Diphtheria and tetanus toxoids have been administered simultaneously by the French with good results. In Denmark injections of diphtheria toxoid are being supplemented and augmented with nasal instillations of the product for the purpose of re-enforcing and later for re-establishing the immunity which is produced by the injected toxoid. (P. S. B.)

**Sewage Disposal:** see PUBLIC HEALTH ENGINEERING: *Sewage Treatment*.

**Seychelles.** A British crown colony in the Indian ocean, consisting of 92 islands between 4° and 10° S. lat., and 46° and 57° E. long. The governor and commander-in-chief is Sir A. F. Grimble, K.C.M.G.; and the capital is Victoria, in Mahé.

The aggregate area is c. 156 sq.mi., of which Mahé accounts for 55 sq.mi.; and the total population is 29,803 (Mahé 25,367). There are no railways or telephones. There is a mail steamer once a week, and air mails arrive via Karachi and Nairobi. The principal products, with 1935 production figures, are coco-nuts (47,000 tons) and copra (4,311½ tons); 57,130 kilos of cinnamon, valued at Rs.189,929, were also produced. Exports for 1935 amounted to Rs.996,169, and imports to Rs.891,350.

The currency is the Indian silver rupee. There is an income tax and a rural house tax. Revenue and expenditure for 1935 were Rs.728,173 and Rs.675,058 respectively.

**Share-the-Wealth Program.** In Aug. 1934, Upton Sinclair, author of many crusading books, won the Democratic nomination for governor of California. His program, known as E.P.I.C. or End Poverty in California, divided the voters into two classes, 10% of the comparatively rich who would lose by the policy and 90% who would gain. The program was to be carried out by certain agencies: C.A.L. (California Authority for Land) which would take over farms, particularly when notified for sale owing to tax arrears, and have them worked by unemployed; C.A.M. (California Authority for Money) which would issue bonds to finance the program and scrip cash as wages to the workers to be negotiable in stores man-

aged under the system; and C.A.P. (California Authority for Production) which would purchase idle factories and work them by unemployed. The State income tax in addition to the Federal tax would begin at \$5,000 a year and graduation would reach 30% at \$50,000 which would become, in effect, the maximum income enjoyable in California. Bequests up to \$50,000 would be free of State taxation. Above that figure, the tax would be 50%. In the election of 1934 Upton Sinclair was defeated by Frank F. Merriam, Republican.

His proposals have to be correlated with the contemporary Townsend Plan (*q.v.*), the radicalism of Governor Huey Long of Louisiana, the Alberta Policy of Premier William Aberhart (*q.v.*), and the theories of national dividend propounded by Major Clifford Hugh Douglas of Great Britain.

**Sheep.** A bumper corn crop, together with large yields of forage, resulted in the U.S. corn belt States having 3,286,000 lambs on feed Jan. 1, 1938, the second largest number on record. Every corn belt State, excepting Wisconsin and Minnesota, was fattening unusually large numbers of lambs. The lamb crop in the United States in 1937 numbered 30,712,000, which was 267,000, or less than 1%, under the 1936 crop, but about 2% larger than the five-year (1931-35) average. The total number of sheep and lambs in the U.S. on January 1 was 52,918,000 in 1938 and 52,588,000 in 1937. The slaughter of sheep and lambs, under U.S. government supervision, in 1937 was 17,250,000, compared to 17,216,000 in 1936 and a five-year average of 16,809,000. The U.S. wool clip in 1937 was estimated at 367,359,000lbs., which was about 7,000,000lbs. more than in 1936.

New Zealand in 1937 reached the highest point in its history in sheep production, the flocks numbering 31,315,818. The New Zealand wool clip was 315,400,000 pounds. South Africa, despite severe droughts that developed in the autumn, made a further increase in wool production, the 1936-37 wool clip being 266,945,000lbs., compared to 237,835,000 the preceding year. This was an increase of 28% in three years.

Owing to the break in prices the latter part of 1937 the South African Government announced that wool offerings would be limited in 1938 and the Government planned to finance farmers who wished to hold their wool. Although wool prices later improved Australian selling brokers announced that the selling season would be extended to June.

The United Kingdom entered 1938 with some slight increase in the number of ewes kept for breeding purposes. Sheep and lambs in England and Wales in 1937 numbered 17,182,800, compared to 16,648,000 in 1936. In Scotland there was a slight decline, 7,503,500 in 1937 and 7,557,000 in 1936, while in Canada there was a slight increase, 3,339,000 in 1937 and 3,327,000 in 1936.

Foot-and-mouth disease was severe among the flocks of France in 1937 and caused heavy losses of lambs. This is not reflected in the official figures, which are for the beginning of the year and show a sheep census of 9,788,000, an increase of 230,000 over 1936. No 1937 figures are available but Russia is said to have increased its number of sheep from 45,400,000 in 1933 to 64,000,000 in 1936. (*See also* LIVESTOCK.) (S. O. R.)

**Sheppard, Hugh Richard** (1880-1937), canon of St. Paul's Cathedral in London, was England's leading pacifist and an active social worker. For many years vicar of St. Martin's-in-the-Fields (1914-1927) and also dean of Canterbury (1929-1931), he wrote several books on religious subjects and was known widely through his broadcast sermons. He died in London, Oct. 31, 1937.

**Shingmun Dam:** *see* DAMS.

**Shintoism.** Shinto, the Way of The Gods, is the name of the indigenous religion of Japan. It has a long history, dating back to dim pre-historic times. Shintoism started as a form of animism, the sun and moon, fire, mountains, rocks, trees, animals and other natural objects being objects of adoration. Some atmosphere of animism still clings to the faith; and Shinto shrines, the entrance to which is always marked by a *torii*, or cross-bar, are usually located in beautiful natural surroundings, on the tops of mountains, or in the midst of groves, with running water nearby. Shintoism gradually evolved from animism into polytheism; its mythology is recorded in old chronicles of Japan, such as the *Kojiki* and the *Nihongi*. A special place of honour is accorded to Amaterasu-Omikami, the Sun-Goddess, who is regarded as the ancestor of the Japanese imperial family. Shintoism was substantially modified by the impact of Buddhism, which came into Japan from Korea and China in the sixth century, A.D. With its much more highly developed ethical and philosophical system, Buddhism tended to overshadow Shintoism, although the indigenous faith was not abandoned. There was some tendency toward amalgamation of the two systems; the traditional Shinto gods were identified with Buddhist deities. Shintoism also became permeated with Buddhist moral conceptions. There was a marked revival of Shintoism in the 18th century; and this was one of the most important spiritual forces which led to the overthrow of the Shogunate and the restoration of the Imperial power in 1868. Since the restoration a distinction has been drawn between Shintoism as a religion, which any Japanese may or may not profess, and so-called state Shintoism, which is regarded as a form of patriotic observance, compulsory for all Japanese subjects. A feature of state Shintoism is the performance of obeisance before shrines which are sacred to the memory of emperors and Japanese who have distinguished themselves in their country's service. The content of Shintoism has been officially defined as follows: (1) to practice principles of love of country and reverence for the gods; (2) to make clear the reason of heaven and the way of man; (3) to accept gratefully the rule of the emperor and to obey his will.

BIBLIOGRAPHY.—W. G. Aston, *Shinto, The Way of The Gods*; G. Kato, *A Study of Shinto, the Religion of the Japanese Nation*; I. Nitobe, *Japan*. (W. H. CH.)

**Shipbuilding.** The year 1937 opened with high hopes for the shipbuilding industry, but ended in disappointment and anxiety in practically all countries. Although prices were beginning to rise at the end of 1936, there was, generally speaking, little anxiety, as there were plenty of new orders coming into the yards; but within a short time prices had risen to such an extent that few shipowners could order new tonnage with any prospect of financial return, and new orders were practically confined to naval work and ships which, for one reason or another, had to be built for the special purposes of their owners.

This tendency was the same in all countries where the shipbuilding industry was not controlled. In Britain the figures were very carefully examined, and it was shown that shipbuilding prices advanced by roughly 75%, varying with the district and type of ship built, in nine months. Of this increase 70% was due to causes entirely beyond the control of the shipbuilders; and, ironically, one of the first increases was due to the increased freights that the owners were getting on imported steel plates.

The rise in prices naturally caused serious loss to builders who had taken contracts at the beginning of the revival at only a reasonable profit, to help cover work taken at a loss during the depression in order to keep the technical personnel together. In the case of the Orient liner "Orcades" (23,456 tons), which was

ordered in 1935, the owners announced that she would have cost them £400,000 more had she been ordered at the end of 1937. With improved freights and the demand for immediate delivery, many ships which had been built at a loss were sold, sometimes before delivery, at a very high price, to the chagrin of the builders. It is unfortunate that the general level of shipbuilding prices is unlikely to fall for some time at least.

For a large part of the year the builders of most countries in the world were also handicapped by the shortage of steel, and this was made worse by the rearmament programs, which demanded priority. Deliveries were delayed, in many cases, until the peak of freights had been passed.

Short as the revival was, it had far-reaching results. During the long slump a large number of economizing devices had been patented, both in the hull, to reduce the horse-power necessary, and in the machinery, to reduce the fuel consumption per horse-power. Many of these, whose patentees were not in a position to build or convert ships to demonstrate them, seemed likely to pass without recognition, but when shipbuilding was revived, it was fully realized that many costs were bound to rise, and must be balanced by fuel economy and greater efficiency. Ideas were therefore given a practical test at sea, in competition with others, and the general standards were greatly improved.

Technical opinion is not unanimous as to the extent to which these improvements should be taken; it is actually a matter of mathematical calculation to balance the probable earning powers of the ship during her normal life with the first cost, and the interest and depreciation which depend on it. Complicated construction and royalty fees may render her unprofitable, while all claims to improved economy are justified. Alongside many ships of the most ingenious design, there have therefore been built a number whose keynote is simplicity, although the general use of testing tanks for all new ships has vastly improved hull forms. The difficult design of the popular motor coaster, with its shallow draught, has been strikingly improved by this means, particularly round the stern.

In the engine room the most striking feature of the year 1937 was the reaction in many places towards steam against the Diesel engine. This has been most conspicuous in Japan and the Scandinavian countries, in which the Diesel engine appeared to be adopted for all types, but where each case is now considered on its merits. The steam plant installed is nearly always one of the improved economy types, of which many have been patented, and the general tendency of all steam plants is towards higher pressure.

The advantages of higher pressure and more modern engines are well known in the acceleration of the Union-Castle steamers for the new Cape mail contract, which demands about 20 knots instead of 17. This was contrived so economically in space that it was possible to suppress one of the boiler-rooms necessary when the ships were built in 1921 and 1922, and to substitute oil-fuel tanks. In the later motor ships, entirely new Diesel engines, two-stroke double-acting, of 50% greater power, had to be substituted, but it was possible to obtain the increased power without increasing the machinery space. The modernization of motor ships in similar fashion to satisfy the constant demand for higher speed is being carried out on a large scale in Italy and Germany, generally with an improvement of the bow lines by drawing out the hull forward.

The substitution of welding for riveting has made great progress during the year to save weight. In most cases only certain parts of the ship, internally and on deck, are welded, but several ships have been built entirely by that process, and are being carefully watched on service.

One of the most interesting types for which all-welding has been

tried is the spirit tanker, for the rapid corrosion of these ships always starts round the rivet-heads. This experiment is being tried principally in the United States, where steam is still favoured, while practically every modern tanker in Europe is Diesel-driven. American owners have also carefully tested tankers with the Arcform hull against those of orthodox design, and have obtained approximately the same speed with 3,000 s.h.p. against 3,500.

The maximum economical speed for tankers on ordinary commercial service is still in the neighbourhood of 13 knots, but the construction of a number of Japanese motor tankers, with State aid for naval purposes, with trial speeds of 19 and 20 knots has caused great interest, especially in the United States, where the Government is being urged to take similar steps.

The German shipbuilding industry has been working to capacity, under strict control, on the modernization of the German merchant service, and has obtained a large number of foreign orders through the currency regulations. The Italians are planning a

ANOTHER GIANT OCEAN LINER for England, the Ship 552, sister ship of the "Queen Mary," being built at Clydebank, Scotland

U. S. "LEVIATHAN," formerly the German "Vaterland" and largest ship of its day, sold for scrap metal to a British firm

colossal State-aided shipbuilding program, aggregating 1,000,000 tons gross. The first 250,000 tons are to be for the modernization of the liner fleets, the remainder for the creation of an up-to-date tramping fleet on what are understood to be novel designs. The Russian Government has had great difficulty in keeping to schedule with merchant shipbuilding in its national yards, but that is probably due to increased pressure of naval work, details of which have been kept very secret.

The most interesting ships started or completed during the year are the improved "Queen Mary" for the Cunard-White Star Line, and the same company's new "intermediate" steamer "Mauretania," with a gross tonnage of about 35,000 and a speed of 22 knots. A very similar ship is being built for the United States Lines to replace the "Leviathan." For the long voyage to Australia the Shaw Savill Line is building the 27,000 ton "Dominion Monarch," with a speed of 19½ knots, with four opposed-piston Diesels. The Belgian Government's cross-Channel packet "Prins Albert" is now the fastest merchant motor ship afloat. (See also SHIPPING, MERCHANT MARINE.) (F. C. Bo.)

**Shipping, Merchant Marine.** Nineteen-thirty-seven was a year of great importance to shipping all over the world, and of not a little difficulty. The latter part of 1936 showed promise of better times after the

longest slump in history, lasting with practically no break since 1921 and in intensified form since 1929; and the first nine months of 1937 more than fulfilled the promise. It was generally realized, however, that only a proportion of the progress was due to a permanent improvement in genuine international trade, the greater part being owing to an unusual grain movement due to crop failures, the rearmament policy of the various Powers demanding raw materials, and warlike operations in Spain and the Far East.

**Tramps.**—The improvement was most conspicuous on the tramping side—ships chartered to take full cargoes by single interests as opposed to the liners running to regular schedule with the goods of numerous shippers and the rates of freight were helped by the withdrawal of so many Spanish and Japanese tramps from the market. The index figure prepared monthly by the chamber of shipping of the United Kingdom may be taken as giving a very fair indication of the tramping business all over the world. Taking the average of 1929 as 100, the figure in January was 131 and the peak in September 172.2, less than 43% of the 1920 rates, after which it declined sharply. As the British Tramp Subsidy Law of 1935 was based entirely on the 1929 level of freights, the owners received no help from the State.

The greater demand for tramps showed the advantage of the more up-to-date ships built with improved hull forms and machinery (see SHIPBUILDING), whose speed was generally better than the older types, especially in bad weather, and which were therefore enabled to make more voyages, while they were more economical in manning, fuel, insurance premiums, port dues, and many other directions. The general increase in practically every expense paid by the ship-owner, more under some flags than others but considerable everywhere, prevented most tramps showing the profit suggested by the better freights.

**Seamen.**—Although there were, only a few years ago, a large number of seamen of all grades unemployed, the continuance of the slump with so many ships laid up naturally having caused many of these men to seek work ashore, when the ships were re-commissioned there was, in most countries, a serious shortage of trained seamen of good reputation. In order to tempt lads of the right type to become seamen—and to remain at sea when they were trained—it has been necessary for the owners to make great concessions in pay, hours of work, victualling, conditions, and accommodation, which have added greatly to the expense of running ships. In the British merchant service a contributory pension scheme has been established for all officers, the owners raising pay sufficiently to cover the officers' contributions, and social legislation or regulation has been framed in most European countries to make sea life more attractive.

Throughout Europe the greatest shortage has been in qualified marine engineers. This has been caused partly by naval demand on terms which are generally tempting, partly by better chances of employment ashore, especially in munition works and public utility undertakings, and partly by the shortage of recruits through the idleness of the shipyards and engineering works, in which the marine engineer usually serves his apprenticeship, during the depression.

These difficulties and increased running expenses of the shipping industry have helped to bring about a spirit of co-operation in a business in which co-operation has generally been regarded as impossible and cut-throat competition the recognized condition, even within each national flag. When the British Government introduced the tramp subsidy, it was made a condition that the owners benefiting should co-operate as much as possible. Not only was this done, but when the subsidy was discontinued and there was no question of compulsion, British tramp owners decided to continue voluntarily. More than that, owners of cargo liners agreed to work with the tramp interests, and at the end of the

FOUR OF THE WORLD'S LARGEST LINERS and a smaller ship docked at New York. Left to right: the "Europa," "Rex," "Normandie," "Georgic" and "Berengaria"

year a large proportion of the tramp ship-owners on the continent of Europe came into the scheme. The minimum freights thus established make practically no difference to the retail prices of commodities, particularly foodstuffs, but they make all the difference to the ship-owner.

Generally speaking, the cargo liner companies did not benefit by the better freights nearly as much as the tramps. Their published rates are in most cases regulated by conferences among themselves and also by long-term agreements with their clients, so that when the rising expenses that they shared with the tramp owners forced them to increase their rates, it was by very slow degrees, for which many firms were blamed by their shareholders. Experience in the latter part of the year proved their policy to be a wise one; when commodity prices became uncertain, the consignees were not so willing to incur the risk of importing full cargoes, and had the parcels rates of the liners been less reasonable, they would probably not have ordered at all. A number of the older and slower ships built as cargo liners were sent to the tramp trade when they could not satisfy the merchants' demand for speedy delivery, and many of the new, fast ships designed as tramps were taken up on time charter by the liner companies.

**War.**—The Spanish and Japanese campaigns had a big influence on shipping business, and not only by their withdrawal of tonnage from the market. The Japanese had time-chartered a number of ships, mostly Scandinavian, during the period of preparation, and the question of war risk to these ships soon assumed an acute form. In the Spanish trade, also, this aspect became very important, although both sides were willing to pay almost any price for shipping facilities. The considerable use of air attack on shipping, often well outside territorial limits and frequently directed, on account of the difficulties of identification, against ships which had nothing to do with the war, proved that post-war

international agreements for the safety of the crews of merchant ships attacked are quite useless in wartime, although, on the other hand, air attack on unprotected merchantmen has proved surprisingly futile. The few ships that have been destroyed have all been of very small tonnage; when bigger ships were attacked, even in favourable circumstances, direct hits proved very difficult to score, and when they were registered, the damage done was very much less than had been anticipated.

The utilization of shipping in the war areas has again brought up the old sore point of national registration: on the one hand, there is strong feeling in some countries against the national flag being used for the protection of ships which are really foreign in every respect except formal registration, and in other countries there is anxiety concerning the transfer of ships, badly needed for national purposes, to foreign flags in order to take full advantage of war prices. Some of the minor Powers, on the other hand, have encouraged these transfers to obtain the benefit of the situation.

**Scrapping Market.**—Owing to the profits to be made by any efficient ship, the scrapping market has been restricted to those ships which would cost too much to put into running order or those whose type prevented their being run at a profit. The maximum economical price was soon reached, but at that the ship-breakers bought practically every available ship, headed by the famous American "Leviathan," which was the biggest ship in the world when she was built as the German "Vaterland" just before the World War. She and a number of steel steamers, built for the U.S. shipping board between 1918 and 1920, crossed the Atlantic to be broken up.

**Passenger Business.**—Generally speaking, the passenger business during the year has been fairly prosperous, although handicapped by increased prices like the other sides of the shipping

industry. The increased number of stewards demanded by the modern passenger has had much to do with that, while the individual stewards have to be better paid and very much better accommodated. A larger number of passengers have booked on most of the regular routes, but the special rush of overseas visitors to Britain for the coronation of King George VI, and the use of passenger liners as floating hotels in the Thames during the coronation season, proved very disappointing.

Generally speaking, yachting cruises in Europe have not proved as popular as in previous years, with the conspicuous exception of certain popular ships, whose owners have made a very special study of the demands of the business. One reason for this was certainly the necessity of cutting out the popular Spanish calls in the shorter and cheaper cruises. On the other hand, European passenger ships which have a convenient call from which there are good facilities for returning by another ship after a conveniently short stay have found a rapidly increasing number of holiday-making passengers, and more have booked for the whole of a long voyage for purely pleasure purposes.

Another very interesting development of the passenger business has been the increasing tendency to travel in the fast cargo liners, of which most of the modern ones have been designed to carry the maximum number of passengers without a passenger licence, generally 12. Although they cannot offer the social amenities of the purely passenger ship, their accommodation is usually very comfortable, and they are particularly popular with invalids ordered a sea voyage as a rest, and business men visiting their overseas connections, who find the time that has to be spent in port handling cargo much more convenient than the short stays of the mail ships, which force them either to hurry their business or else waste time waiting for the next ship to call.

**Trading Restrictions.**—On the question of subsidies and trading restrictions the shipping world is divided, much as it was before, between the States which believe in the policy and those which do not. There have been no major changes of policy, and the principal alterations in detail have been in the United States, where the authorities have rationalized the payment of subsidies to save money where there has been inadequate national return. Although, in accordance with her usual practice, all details are kept secret until the plan is complete, Japan is generally understood to be preparing a complete revision of her subsidy system to right the weaknesses in her merchant navy revealed during the operations in China.

**Russia.**—Russia's State fleet has been steadily increased, partly by purchase abroad, but principally by new construction under the current five-year plan, and the charter of foreign ships for foreign trade has naturally declined. The ultimate aim of carrying all Russian trade in Soviet Government ships is constantly kept in mind. The use of the northern seaway across the top of Siberia—the north-east passage which cost the lives of so many early explorers—has been increased, and the work of the scientific stations along it has eliminated many of its dangers, but this year has shown that it is still very much influenced by weather.

**Sailing Ships.**—Several of the few remaining sailing ships have gone from the list, some through disaster and others through being worn out, but the big ones in Europe have, for the first time for many years, secured outward business for at least part of their voyage to Australia and excellent freights for the carriage of grain home to Europe. At the same time their expenses are heavier, partly for the replacement of sails, etc., which is inevitable, and partly because the reduced demand for sail-trained seamen has robbed them of cheap crews.

The British Trinity House no longer demands sail experience before it will issue a sea-pilot's licence, and the Swedish Government has given up the same qualification for an officer's certificate.

The German authorities, however, have refused to follow suit.

The shipping of practically every country in the world where trade-unionism is allowed has been embarrassed by labour troubles during the year, either in the docks or in the ships or both. (See also UNITED STATES: *Merchant Marine*.) (F. C. Bo.)

**Shoe Industry.** Shoemaking is increasing rapidly the world over. Conservative estimates of production for 1937 indicate a 10% increase over the figures compiled by the United States Department of Commerce for 1936, which follow: Europe, 490,000,000 pairs, including United Kingdom, 130,000,000 pairs; Germany, 76,000,000; France, 50,000,000; Czechoslovakia, 30,000,000; and Russia, where estimates of outputs vary considerably, but reliable sources indicate not over 45,000,000 pairs. North America, 449,721,000 pairs, including United States, 415,000,000; Canada, 22,000,000; Mexico, 5,250,000. South America, 45,520,000 pairs, including Brazil, 19,000,000 pairs, and Argentina, 16,000,000. Asia and Oceania, 61,400,000 pairs, including Australia, 15,000,000 pairs of leather shoes and a volume of slippers estimated at 6,000,000 pairs; British India, 4,300,000 pairs; China, 7,500,000; Japan, 9,500,000. Africa, 16,000,000 pairs, of which the South African Union produces about 47%. Production in the United States accounts for almost 40% of the world's total, with preliminary data placing the 1937 estimated output at 450,000,000 pairs.

Two factors contributed to the increased world-wide shoe production: (1) increased efficiency and economy in shoemaking and an appreciation the world over of a wider range of sizes and widths, necessitating larger basic stocks in warehouses, stores and consumers' hands, and (2) footwear for military use because of wars and rumours of wars.

The mechanization of the shoe industry has been accelerated by the international use of mechanical equipment developed first in the United States, and now in universal use. Shoemaking skills will continue to increase in countries not now using machine-made shoes for general wear because of the aptitudes developed through the use of the sewing machine.

**Trading.**—Export trade has been made more complicated by preferential rates of import duties granted in British Empire countries to products originating within the Empire. Other nations have established embargoes and quotas and higher duties to shelter their own shoe markets. The United States trade agreements have had little effect in increasing the export or import of footwear; and with the exception of a contemplated Czechoslovakian trade agreement, proposed in 1937, which was violently objected to by the shoe industry in the United States, there has been no conflict in reciprocal agreements.

**Rubber Footwear.**—Rubber boots, galoshes, overshoes and rubber-soled canvas shoes, showed signs of increasing in production in 1937, for certain types of rubber footwear can be made so cheaply in price that they serve the purpose of foot covering. The export and importation of rubber footwear between countries is decreasing; and it is doubtful whether the all-time record of 80,000,000 pairs produced in 1933, will be surpassed.

(A. D. AN.)

**Shooting.** Probably a larger head of game was reared in Great Britain during 1937 than at any time since the war. While the sale and breaking-up of many large estates has had the effect of reducing the bags of individuals and on any one property, credit must be given to the system of syndicate shooting for the present satisfactory state of preservation obtaining today. It can also be said that more persons shoot now than formerly. If grouse were "patchy" owing to the depredations of the heather beetle, and partridges scarce in places on account of disease,

pheasants did extremely well, and among wild fowl greater numbers of geese, especially brent, have been in evidence. In America more attention is being directed towards methods of game preservation, partly perhaps because duck shooting—the mainstay of American shooters—has, since the recent years of drought, not reached its usual standard.

Clay-pigeon shooting, which affords excellent practice, continues to be a popular form of sport. In rifle shooting, the Scottish deer-stalking season produced a few good heads; while on the Bisley ranges the King's Prize was won for the first time by a member of the O.T.C.—D. L. Birney, lately of Cambridge university—and the Dewar cup (miniature rifle shooting) was won by the English team for the first time for many years. (See also TRAP-SHOOTING.) (W. H. T. L.)

## Shows.

In the United States, at the South-western Exposition and Fat Stock show, 5,000 head of stock were entered, and 250,000 people attended. Awards at the Illinois State fair amounted to \$150,000, and at the Missouri State fair to \$48,000, where attendance reached 270,800. The American Royal Livestock show in Kansas City laid emphasis on young farmers, and at the Nebraska show the chief competitions were for junior farmers. The 38th International Live Stock exposition was held in the new amphitheatre at Chicago stockyards. The judge of the international steer class was Alexander Ritchie, of England.

In Great Britain, a new challenge cup was offered at the Perth show for the best three bulls, offspring of one sire, and the champion bull fetched 700 guineas. The duke and duchess of Gloucester attended the Ayr Centenary show, at which Mr. Kilpatrick won the male and British Friesian and Mr. McAlister the Ayrshire cattle championships. The King won at the Devon Coronation show, and at the Royal Counties show, Reading, he showed the best young bull. The minister of agriculture visited the Three Counties show, where Herefords led with 98 out of 1,203 entries; "Freetown Endor" was champion bull and "Phocle Rosina" champion female. "Greencroft Marquis" was male champion at Newcastle, and also at Lancashire, where "Holmescales Meadowsweet" won the supreme championship for dairy cows. At the Royal show, Wolverhampton, 16 prizes went to Scotland. The duke of Westminster won the Brackenhurst trophy. British Friesians won the Bledisloe trophy at the British Dairy Farmers' Association show, and "Fothering Foggathorpe II's" awards included the supreme individual championship trophy. At the National Dairy show, Mr. Ball won outright the Spencer challenge cup.

**Horticultural.**—At the International Flower show, New York, the New York Botanic Garden won a medal for Mediterranean plants. Entries from foreign countries were received for floriculture at the Illinois State fair, which included a gladiolus show. Nearly \$1,000 were offered at the Missouri State fair for horticulture.

At the Royal Horticultural Society's spring show, at Chelsea, London, the Sherwood challenge cup went to Messrs. Allwood, the Cain challenge cup for amateurs to Mr. Lionel de Rothschild, and the trophy for the best six orchids by amateurs to Mr. Wharton. At the autumn show, the Coronation cup was won by Messrs. Sutton, and also a silver gilt cup to commemorate the accession. Similar cups went to Mr. J. Pierpont Morgan, Messrs. Hillier, and Mr. Stuart Ogg, and the Wigan rose cup to Mr. Alex. Dickson. At the British Carnation Society's show the *Daily Mail* challenge cup was won by Messrs. Allwood. Only four new varieties were entered at the National Rose Society's show. To commemorate the coronation, every gold medallist received a cup. At the National Dahlia Society's show the best new variety was by Messrs. Stredwick, and Mr. Valentine Smith won the amateur cup. Mr.

Ingwersen won the Farrer memorial medal at the Alpine Garden Society's show.

**Horses.**—In the United States, classes for draft horses were included in the International show at Chicago and the Illinois State fair.

At the American Royal show there were classes for all light horses and drills by artillery teams. The Illinois State fair had the same range of light horses in addition to draft horses. A novelty at the South-western exposition was "Dressage," the art of guiding a horse without apparent movement or sound.

At the British Shire Horse Society's show, Messrs. Mann, Crossman & Paulin produced the best commercial exhibit, and a judging competition for young farmers was held. The male, reserve, and female champions were similarly placed at the Royal show, where Messrs. Chivers won the male championship for percherons. Mr. Kilpatrick won the Glasgow Stallion show's supreme championship for the 12th time, and a Clydesdale won the 1938 premium of £100. Clydesdales from Scotland won at the Melbourne Royal show, Australia, and at the Canadian National exhibition.

At the International Horse show, London, foreign jumping teams came from the United States, France, Germany, Belgium, Rumania, Turkey, and Ireland, the last-named winning the Edward, Prince of Wales, Gold challenge cup. The King George V cup for officers' jumping went to France.

The Buccleuch Hunter Breeding Society inaugurated an annual show of hunters and young stock. Captain Buchanan owned the champion thoroughbred stallion at the Thoroughbred and Hunter show. Lord Inverclyde owned the champion hunter at the Kilmarnock show. At the Highland and Agricultural Society's show, 61 hunters, 35 Highland, and 29 Shetland ponies were entered.

**Dogs.**—In the United States, the Morris and Essex show offered 275 sterling silver trophies to be won outright. The best dog was an English setter. At the American Fox Terrier Club show the best was "Glynhir Golden."

In the English shows, cocker spaniels led the numbers. In Scotland Labradors were favourites. Cruft's had 9,949 entries. New breeds were Basenjis, hunting dogs from Central Africa, and Rottweilers, guard dogs from south Germany. At the Kennel Club show entries numbered 5,899. Novelties were Pomeranian sheep dogs, a husky, and Bernese and Apenzell mountain dogs. The West of England Ladies' Kennel Society show had 5,607 entries, and there were 4,883 entries at the Ladies' Kennel Association show. At the Kensington show the Frank Butler memorial trophy went to Mr. Chapman's champion "Heather Realization," a Scottish terrier, who was best at the Ayr Centenary show, where there were over 2,000 entries in the dog section. At the National Terrier show, 103 out of 1,539 entries were Cairns; the supreme winner was a Sealyham bitch. Dog breeders in Kenya sent in 200 exhibits to the East African Kennel Club show.

**Cats.**—At the Blue Persian Cat Society's show entries were 353. Prizes for first adult male, best cat, and best exhibition went to "Heatherland Blue Boy," champion at Newbury. The Croydon show had 753 entries, the best was "Sherry of Hanley." At the Thames show, cat section, "Daybell" was the best adult male, and best cat. (V. R.)

**Siam,** kingdom of southern Asia between Burma and French Indo-China, extending southwards into the Malay Peninsula; area, 200,000 square miles; population, 14,500,000. The king (*b.* 1926), Ananda, at present studying in Switzerland, succeeded on the abdication of his uncle and predecessor in 1935; a Council of Regency represents him pending his majority. The people are almost without exception Buddhists of the Hinayana school. There are two universities, one (founded 1934) being

concerned entirely with social science teaching; elementary education is free and compulsory, and is carried on in some 9,000 schools, most of which are connected with Buddhist monasteries. The capital, Bangkok, had a population of 681,000 in 1937; other large towns are Chiangmai (545,000) and Ayuthia (300,000).

**History.**—Since 1932, Siam has been ruled as a democratic constitutional monarchy with a popular assembly, and very rapid progress has been made in recent years in the modernization of the country, particularly since the abdication of King Prajadhipok in 1935. On Aug. 2, 1937, the Council of Regency resigned, after charges had been made of improper sales of land belonging to the king; it was re-elected without change two days later. A treaty of commerce and navigation with Japan was signed on Nov. 2, and a similar treaty with Great Britain on Nov. 23, by which in each case extraterritoriality was abolished. The project of cutting a canal through the Kra isthmus was revived in 1937, and at the end of the year there were strong rumours that Japanese engineers were undertaking preliminary surveys.

**Agriculture.**—Rice is the principal agricultural product; teak, tin, and hides are exported. Communications are being rapidly improved; there are 2,000 mi. of railroad, and recently an 18-year road plan has been put forward, involving an expenditure of some £15,000,000; in the first five years 2,000 mi. of roads are to be reconstructed.

**Finance and Banking.**—The 1937 budget provides for a revenue of £9,536,000 and an expenditure of £9,535,000. The currency unit is the gold baht (formerly the tical), exchanging at 11 to the pound sterling. In 1936–37 the total exports were £16,808,000 and imports £10,007,000. There is no State bank, but most of the Far Eastern and Chinese banks operate in the country.

**Defence.**—Universal military service is exacted; the effective strength of the army is over 25,000. The air force and navy at present are being greatly strengthened, and submarines and warships are on order abroad.

**Siberia,** a geographical term formerly used to denote the whole of Asiatic Russia lying north of Kazakhstan, Mongolia, and Manchuria. The term has no longer any political significance, and even its survival in the eastern Siberian Province and the western Siberian Region of the Russian Soviet Federated Socialist Republic came to an end in Sept. 1937. (See also UNION OF SOVIET SOCIALIST REPUBLICS.)

**Sierra Leone.** A British crown colony and protectorate in West Africa, lying between N. lat. 6° 55' and 10°, and W. long. 10° 16' and 13° 18'. Governor, D. J. Jardine, C.M.G. (appointed 1937); capital, Freetown. It was decided in Dec. 1937 that Freetown was to be provided with a regular peacetime garrison to man its coast defences. The 150th anniversary of the colony's foundation was celebrated, jointly with the coronation, in May.

Total area c. 31,925 sq. mi. (colony, 4,000 sq. mi.). The population of the colony (est. 1935) was 101,960; in 1931 the Europeans numbered 420; pop. of the protectorate (1931 census) was 1,672,2058, including 231 Europeans and 577 Asiatics. Freetown, the capital and port, had (1935) a population of 60,903. There are four secondary schools for boys, and four for girls.

The total length of railways in 1936 was 311 miles. Cable and Wireless, Ltd., maintain a cable office. In 1936 the export of diamonds (first discovered in 1930) was valued at £500,124, and that of palm kernels at £583,645. Total exports were £2,376,965, and imports £1,346,715. The currency of the United Kingdom is legal tender, together with West African silver and alloy coins. Revenue for 1936 was £969,668, and expenditure £879,370.

**Silesia, Upper,** the southern part of the former Prussian province of Silesia, was divided between Germany and Poland after a plebiscite in 1921. As the two parts were inhabited by Germans and Poles closely intermingled, and were rich in coal, iron, zinc, lead and other minerals which had been previously exploited as a single economic unit, Germany and Poland, upon the recommendation of an Inter-Allied Commission, signed on May 15, 1922, the Geneva Convention to assure the protection of minorities and to preserve joint economic arrangements for a transitional period of 15 years. For three years the convention worked unexpectedly well. But in 1925 Germany began a trade war against Poland and suspended the purchase of Polish Upper Silesian coal, causing hardship to Polish miners. In 1926 Dr. Michael Graetzynski became governor of Polish Upper Silesia and at once began, through administrative pressure and through a private army, a vigorous Polonization policy. German business men and employees were forced out under the pretexts of "rationalization," "reorganization" and "incapacity of workers." German commerce was boycotted and schools for German children were closed. By 1937 the German minority in Polish Upper Silesia had been reduced by a mass exodus from 250,000 to half the number.

On July 15, 1937, the Geneva Convention of 1922 expired. The Germans wanted to renew it but the Poles refused. The Germans then extended to German Upper Silesia all the drastic Reich anti-Semitic laws, so that Polish Jews migrated to Poland, though Poland is no bed of roses for Jews. In Polish Upper Silesia a renewed campaign began against Germans: Lutheran pastors were dismissed; the German press was punished; more Germans were thrown out of work; and a law was prepared for expropriating large German agricultural estates in order to parcel them out as small farms to Polish peasants. Feeling became so bitter that Germany and Poland decided to sign on Nov. 5, 1937, a new treaty protecting their respective minorities. But the Germans soon complained, and with reason, that the local authorities in Polish Upper Silesia were not living up to the terms or the spirit of the new treaty. See article SILESIA in *Encyclopædia Britannica*; and W. J. Rose, *The Drama of Upper Silesia* (London, 1937). (S. B. F.)

**Silicosis.** The pneumoconioses, conditions of the lungs due to inhaled dusts, include only two forms generally recognized as symptomatic diseases.

Silicosis results from prolonged inhalation of sufficient quantities of fine, free silica particles. In normal lungs it is manifested by numerous small, uniformly distributed, discrete fibrous nodules. In areas of infection the fibrosis is massive with compensatory emphysema and associated dyspnoea. Only silicosis specifically predisposes to tuberculosis, of which a large but variable proportion of its victims die. Silica is not a mechanical irritant, but possesses specific injurious physio-chemical properties. The generally accepted solubility hypothesis is now being questioned. Recent experiments suggest that other mineral particles associated with silica in the atmosphere may retard its inhalation or action on the tissues.

Asbestosis consists of a diffuse fibrosis originating in the terminal bronchioles and spreading peripherally to obliterate the capillary bed. Dyspnoea and cardiac involvement may be marked in advanced cases. Predisposition to tuberculosis is not proven. Any associated infection often heals, accentuating the pre-existing fibrosis. Recent experiments suggest that asbestos fibres are mechanically irritating; many still believe in a chemical action.

Other silicates have been incriminated, but definite proof of activity is lacking. Non-siliceous inorganic dusts cause pigmentation without appreciable fibrosis. (L. GAR.)

## Silk and Silk Manufacture.

Consumer buying movements in the United States

are marked in two outstanding incidents in the 1937 history of the age-old silk industry. First was the innovation of compulsory labeling of the artificial silk fibre, commonly known as rayon since 1925 but also sold extensively under other private brand names, and the second a consumer boycott, individual and unofficial but growing rapidly by the close of 1937, against products originating in Japan.

The compulsory labeling was ordered by the Federal Trade Commission of the U.S. Government, on Oct. 26, 1937, after several months of preliminary campaigning by federations of women's clubs and similar organizations. The order compelled all handlers of rayon yarn, thread, fabrics or articles containing such yarn, thread or fabrics to use the generic term rayon for manufactured textile fibre or yarn produced chemically from cellulose or with a cellulose base and for thread, strands or fabric made therefrom, regardless of whether such fibre or yarn be made under the viscose, acetate, cuprammonium, nitrocellulose or other process.

Eliminating the confusion between the silk and the substitute fibres had long been anticipated as a boon to the silk industry, especially in garment fabrics, to offset the continually increasing large consumption of rayon. In Dec. 1937, the fabric industry was using only about 25% of the raw silk imported; the hosiery industry 75%. The immediate effect was that compulsory labeling showed that most of the garments were rayon and were giving satisfaction; that the silk industry in the fabric field was almost extinct. In hosiery, it was still silk, because of its superior elasticity over the rayon yarn. Experiments in knitting fine type rayon yarns, however, were alleged to be given impetus by wider public knowledge of the satisfactory wearing quality of rayon in fabrics. An "international incident" aggravated the situation. The Japanese war in China resulted in such a wave of anti-Japanese feeling that by the end of December some hosiery mills, the main-stay of the raw silk Japanese export trade, planned to make cotton lisle hose to meet the consumer demand. While it was pointed out that in an average pair of women's silk hose only 10¢ worth of raw silk was used, the other 70¢ being the value of American labour, the general boycott on things from Japan began to have its effect.

Statistically, the consumption of silk dropped definitely compared with the previous year. Better demand for silk occurred in the first four months of 1937 but after an average May and June, the remaining months witnessed a decline. Stocks of raw silk throughout the world, including Japan, China, Italy, England, the United States, etc., averaged 145,838 bales per month in 1937 compared with 160,871, in 1936.

(I. L. BL.)

## Silver.

The world's silver production is rather heavily centred in North America; this continent in 1929 furnished 75% of the total output, and 65% in 1936; Mexico is the leading producer, with 31%, followed by the United States with 25%, Canada with 9%, and the remainder of the continent (including Central America, West Indies and Newfoundland) 2%. The United States output has recovered from the effects of the depression, and has reached a level slightly above that of 1929, but Canada and Mexico are still low, the latter quite appreciably so. Although the United States, Germany, and especially Japan, Bolivia and the Soviet Union, as well as several of the minor producers have shown increases to above the 1929 level, the world total is low, due chiefly to the heavy deficiency in Mexico, Canada and Peru.

British production of silver is comparatively small; the United Kingdom itself has only a negligible output, and Empire produc-

World Production of Silver  
(In millions of fine ounces)

	1929	1933	1934	1935	1936
Canada . . . . .	23.1	15.2	16.4	16.6	18.2
United States . . . .	60.3	21.0	26.4	38.3	62.8
Mexico . . . . .	108.7	68.1	74.1	75.6	77.5
Other N. America . .	2.8	6.0	4.6	4.6	5.2
Peru . . . . .	21.5	7.3	10.4	17.1	19.0
Bolivia . . . . .	6.2	5.5	5.2	8.0	10.5
Other S. America . .	1.7	0.6	1.4	1.6	1.8
Germany . . . . .	5.5	6.3	5.9	6.3	6.3
U.S.S.R. . . . .	0.4	1.0	2.9	3.9	5.0

Total . . . . .	261.5	169.7	186.4	214.4	250.8

tion centres chiefly in Canada, Australia, India and South Africa. Empire production as a whole is still slightly under the 1929 level in ounces, but by less than the change in world output, so that the proportion of the world total in 1936 was 17% against 16% in 1929, and preliminary reports indicate further improvements in 1937, particularly in Canada.

The recovery of production in the United States has been fostered by the nationalization of silver, and by inflated Government purchases at an artificial price level far above world prices. The price of 77.57¢ per ounce for newly mined domestic silver, set by executive order on Apr. 24, 1935, expired on Dec. 31, 1937, and was re-set at 64.64¢ for 1938, the world price at that time being 44.75¢. Government purchases have also included large amounts of foreign silver, at the world price, with favourable results on the foreign output.

(G. A. Ro.)

## Simons, Walter

(1861-1937), German lawyer and politician; born in Elberfeld, September 24.

Appointed in 1905 to the bench of the Upper Provincial Court at Kiel, Dr. Simons entered the Reich Office of Justice, Berlin, in 1907. In 1911 he joined the legal department of the foreign office. He took a prominent part in the negotiations of the war treaty with Turkey and of the Brest-Litovsk treaty with Russia. In 1918 he became ministerial-director under Prince Max of Baden, and retained that post after the revolution. Returning to the legal department of the foreign office, he went, in Jan. 1919, to Versailles as commissioner-general of the German delegation, but resigned in June rather than accept the allies' terms. From 1920 to 1921 he was foreign minister in the Fehrenbach cabinet, and from 1922 to 1929 was president of the Supreme Court of the Reich. From March to May 1925 he was deputy president of the Reich, filling the gap between Ebert's death and the election of von Hindenburg. Apart from his political and legal activities, Dr. Simons was a prominent churchman, and was president of the Evangelical Social Congress. He died in July 1937.

**Simpson, Mrs. Wallis:** see WINDSOR, EDWARD, H.R.H. THE DUKE OF.

**Sinclair, Upton:** see SHARE-THE-WEALTH PROGRAM.

**Singapore,** the capital of the Straits Settlements (*q.v.*) and main port of south-eastern Asia, is located on an island, of the same name, 27mi. long and 14 broad, area 225sq.mi., at the tip of the Malay peninsula. It is situated at 1°20' north. Population (1936) 490,155, including 347,117 Chinese, 45,077 Malays, 41,402 Indians, 8,338 Europeans, 7,151 Eurasians, 3,695 Japanese and 4,375 others. In 1819 Sir Stamford Raffles obtained Singapore, then a deserted island, from the sultan of Johore for the East India Company for a small fee. It is now a major

trans-shipment port, carrying on trade valued at one billion dollars annually, with shipping of all sorts, amounting to 30,366,511 tons, calling there in 1936. Commanding the main navigable channel through the maze of islands and treacherous reefs in the Malay archipelago and located at the crossroads of south-eastern Asia, where the main trade route from Suez and India diverges northward to China and Japan and southward to Australia and New Zealand, Singapore enjoys an advantageous position in naval strategy as well as in trade. It has been selected as the site of the largest British naval base in the Far East. This base is on the opposite side of the island from the city of Singapore and faces the Strait of Johore, which separates the island from the mainland. Two of its most striking features are an enormous graving dock, 1,000ft. long, and 130ft. wide, completely surrounded by concrete walls and deep enough to handle any ship afloat today. There is also a floating dock, third largest of its kind in the world, which had to be towed out to Singapore in several parts, barely scraping through the Suez canal, and which is able to lift a 50,000 ton battleship out of the water.

By the end of 1937 a base capable of accommodating a powerful squadron of large battleships had been created on what was formerly a jungle swamp, although no considerable naval force had yet been concentrated there. Defence plans for Singapore contemplate co-ordination of land, sea, and air forces. Powerful coast artillery has been mounted at Changi, the town at the eastern entrance to the Strait of Johore. A good deal of attention is being paid to air forces, which include two squadrons of flying boats.

Manoeuvres which were held in February, 1937, with the participation of warships and aeroplanes from places as far removed as Hongkong and Irak, designed to test the defences of Singapore, yielded satisfactory results, according to the official statements which were issued at that time. Singapore is an important centre for commercial aviation, being a port of call both for the Imperial Airways and for the Royal Dutch Airlines. On the neighbouring island of Pulau Brani is the largest tin smelting works in the world.

(W. H. CH.)

**Sin Kiang** (CHINESE TURKESTAN), area 633,802 sq.mi., population 2,588,000, is one of the largest, most remote and sparsely populated sections of China. A large part of this vast territory consists of desert, which accounts for the scanty population. The principal towns are Kashgar (80,000), Yarkand (75,000) in the south-west, and Urumtsi (50,000) in the north. The latter is the seat of the Chinese Administration. The chairman of the Provincial Government is Li Yung. Sin Kiang is not an integral part of China and is largely inhabited by peoples of Turki and Mongolian stock.

Since 1931 the province has been disturbed by intermittent civil wars, which began with the rebellion of some of the Mohammedan tribesmen against the Chinese administration, but have been complicated by local tribal feuds and by Soviet intervention. Soviet troops entered Sin Kiang in 1934 and played an important part in driving back the Mohammedan rebels, who were threatening Urumtsi. Most of the province is now under the control of the Chinese Administration, which is under strong Soviet influence; but some of the southern districts remain in the hands of the insurgents.

A number of émigré White Russians have also been used by the Chinese officials to bolster up their authority. Even before Soviet political intervention took place, Sin Kiang had been gravitating toward the Soviet Union economically because of the disruption through banditry and civil war of the ordinary long caravan routes to China. The completion in 1930 of the Soviet Turkestan-Siberia railway increased this trend; and Soviet exports

"HELLO, MAMMA, we're makin' history." The sit-down strike, as pictured in *The New York World-Telegram*, in W. H. Ch.'s "Metropolitan Movies"

to Sin Kiang increased from 418,000 roubles in 1923-24 to 15,698,000 roubles in 1932.

(W. H. CH.)

**Sino-Japanese War:** see CHINESE-JAPANESE WAR.

**Sit-down Strikes.** In the twenty-ninth year of King Rameses III (1179 B.C.) workers in the royal cemetery of Thebes sat down behind the temple of Thutmose III and refused to work until given their food allowance for the month Tubi (October). "We came here," they said, "because of hunger and thirst; we have no clothes; we have no salves; we have no fish; we have no cabbage." Given some food after three days of argument they resumed work. But in Phamenoth (December) they again "stepped over the wall" and "sat down by the city of the dead" and controversies continued until the second day of Pachon (February) when the workers finally received all the food due them.<sup>1</sup>

Workers constructing the Rouen Cathedral (1485 A.D.) struck for better wages and working conditions. Fearing importation of foreigners, they occupied the unfinished cathedral and declared they would destroy it if attacked by troops. Their victorious strike was followed by other cathedral-builders' sit-downs between 1485 and 1507.

The Lyons bakers' "sit-down" in 1565 was broken by the army. When the typographers of Lyons were ejected from the print shops by the army (1730) they smashed the printing presses. Sit-downs in the Lille textile factories (1750) ended in bloody fights with the troops and replacement of the strikers by German and Belgian weavers. Textile sit-down strikes in England (1817) ended in the burning of the mills during resistance to troops.

More than a century elapsed before the modern sit-down strikes in France and the United States. (See also AMERICAN FEDERATION OF LABOR; COMMITTEE FOR INDUSTRIAL ORGANIZATION; DETROIT; LABOUR; LABOUR UNIONS: *Sit-down Strike*; MICHIGAN: *History*; STRIKES AND LOCK-OUTS; UNITED STATES: *Labour*.) (D. D. L.)

<sup>1</sup> Reported by Dr. W. H. Dubberstein of the Oriental Institute, University of Chicago.

**Skating:** see ICE SKATING.

**Skiing.** The rapid growth which skiing has attained in the United States was temporarily stunted by the scarcity of snow during the winter of 1936-37. Week after week snow trains, scheduled to leave metropolitan areas for mountain resorts, were forced to cancel their trips. Warren Chivers of Dartmouth college won the U.S. combination cross-country and ski-jumping championship in the two-day competition at Minneapolis, Minn., February 13 and 14. He won the cross-country event by 3 minutes and had jumps of 160 and 157 feet. In the class A jumping group Eugene Wilson of Coleraine, Minn., gained top honours with jumps of 201 and 197 feet. Dick Durrance of Dartmouth won the national amateur downhill championship over the course on Boulder mountain, near Ketchum, Idaho, March 13. He was timed in 5 minutes 1.1 seconds. Durrance added to his laurels by winning the national slalom title the following day, making his runs in 1 minute 1 $\frac{3}{4}$  seconds, and 1 minute flat. Dartmouth retained the Intercollegiate Ski Union championship and the Dartmouth Cup with a perfect score of 500 points in the annual three-day competition at St. Marguerite, Quebec, February 25 to 27. The United States Eastern Amateur Ski Association's annual jumping championships had in its entry a fine array of international talent. The contests marked the official opening of the 60-metre slide on Rowe mountain in New Hampshire, February 28. Sigmund Ruud of Norway, with leaps of 218 and 202 feet, won the class A jumping by the slim margin of nine-tenths of a point over his compatriot, Sverre Kolterud, who leaped 214 and 204 feet. Kolterud was adjudged winner of the Eastern combined championship, having won the cross-country race the previous day. (J. B. P.)

**Slate.** The leading slate producers, in order of importance, are the United States, United Kingdom, France, and Germany; the Soviet Union, India, Belgium, Sweden, Australia and Canada account for possibly 10% of the output, and the four leaders the remainder. The United States output, which ranks first, has approximately doubled from the low point of 1933, reaching 452,400 short tons in 1936, which is still 25-30% below the pre-depression level. About 64% of the output is sold as granules and flour, 30% as roofing slate, 6% as structural and sanitary slabs, flagstones, blackboards, electrical switchboards and insulation, grave vaults, school slates, and billiard table tops. The domestic industry is practically self-contained, exports and imports being negligible. (G. A. Ro.)

**Smigly-Rydz, Edward** (1886- ), inspector-general and marshal (from Nov. 1936) of the Polish army, and since July 1936 leading citizen of the Polish State, taking rank immediately after the president; since the death of Marshal Pilsudski in 1935 has been virtually dictator of his country. In his early years he studied painting, and later took part, as a Legionnaire, in the Russo-Polish war of 1921, and was responsible for the Polish capture of Kiev. Succeeding Pilsudski in the leadership of the army, in May 1936 General Smigly-Rydz entrusted Colonel Adam Koc with the formation of a program "suited to the interests of the Polish State," and in April 1937 announced his support, and that of President Moscicki, of the consequent "National Unity" campaign. On Nov. 21 he broadcast an appeal for the unity of the nation on the basis of Colonel Koc's proposals.

**Smith, Annie Lorrain** (1854-1937), British botanist; born at Halfmorton, Dumfriesshire, Scotland, October 23. She was eminent in the field of lichenology,

## SKATING—SNOWDEN, PHILIP

having written the second volume (1911) of J. M. Crombie's *Monograph of Lichens*, and rewritten the first volume (1918). Her text-book on lichens (1921) is the most thorough and exhaustive book on this subject yet published. She contributed the article on lichens in the 14th edition of the *Encyclopædia Britannica*. She died in London, Sept. 7, 1937.

**Smith, Sir Grafton Eliot** (1871-1937), British anthropologist who held that the cradle of mankind was in the region north of the Himalayas. Born at Grafton, New South Wales, Aug. 15, 1871, he studied medicine at Sydney and Cambridge universities and successively held the chairs of anatomy at the University of Manchester, the Egyptian Government School of Medicine and the University of London. From 1913-19 he served as a member of the General Medical Council. He was a past president of the Anatomical Society of Great Britain and Ireland, of the Manchester Literary and Philosophical Society and of the anthropological section of the British Association for the Advancement of Science. The Royal Society and the Royal College of Surgeons awarded him gold medals. In such books as *The Ancient Egyptians* (1911), *The Royal Mummies* (1912), and *Tutankhamen* (1923), Sir Grafton set forth his views on the culture of ancient Egypt. His anthropological studies included *Migrations of Early Culture* (1915), *The Evolution of Man* (1924), *The Search for Man's Ancestors* (1931), *In the Beginning* (1932), and *The Diffusion of Culture* (1933). He was knighted in 1934 and died in London, Jan. 1, 1937.

**Smith College.** In 1937 Smith college, Northampton, Mass., added to its equipment two new dormitories, completing the plan which makes possible the housing on the campus of all undergraduates who do not live in their own homes. There are now 36 dormitories with a capacity of 1,933 beds. The college has continued to develop the Junior Year Abroad, and for some time has been sending students for their junior year to France, Italy, Germany, and Spain. On account of the civil war, the students specializing in Spanish have gone to Mexico this year. An addition to the library has been built to shelve 250,000 additional volumes. It contains also working quarters for the library staff, studies for thirty members of the faculty, a treasure room, a room for archives, twelve seminar rooms, a hundred carrels for individual study, a social room for the faculty, a new book room, and a small chapel. The library now contains about 250,000 volumes. The physical education department has instituted a graduate course designed for students who intend to teach this subject. (W. A. N.)

**Smyth, Herbert Weir** (1857-1937), American professor of Greek at Harvard university, died at Bar Harbor, Me., July 16, 1937. For particulars regarding his career, see the *Encyclopædia Britannica*, vol. 20, p. 848.

**Snooker:** see BILLIARDS: Great Britain.

**Snowden, Philip Snowden,** 1ST VISCOUNT, of Ickornshaw (1864-1937), British statesman; born at Cowling, Yorks., July 18. Snowden remained chancellor of the exchequer on the formation of the National Government in 1931, and after the general election of that year, was created a viscount and remained in the cabinet as lord privy seal until Sept. 1932, when he resigned owing to his disagreement with the Government's tariffs policy. Lord Snowden's subsequent speeches in the House of Lords were characterized by the bitterness of his criticisms of the Government, and particularly of Mr. Ramsay MacDonald. His later publications included *An Auto-*

*biography* (2 vols., 1864–1932), 1934. He died at Tilford, Surrey, May 15, 1937. The peerage became extinct at his death. For a biographical notice, see *Encyclopædia Britannica*, vol. 20, p. 856.

**Soap, Perfumery and Cosmetics.** The development of the toilet preparations industry during 1937 has been chiefly remarkable in the province of cosmetics. Thus, modern face powders are no longer produced by the simple but antiquated mixing process, but are scientifically blended in centrifugal screening and sifting machines. Likewise, beauty milks and creams may be perfectly dispersed and stabilized by means of colloid mills and homogenizers. Petroleum derivatives, though cheap, are beginning to lose some of their popularity to oils of animal and vegetable origin. Preparations that have but recently come to the fore include foam baths, soapless shampoos, and the group of hormone and vitamin creams, etc., known collectively as “biological” preparations.

Chemically, the most important feature of the year has been the controversy over vitamin F (isomeric linoleic acid), known to the trade as the “skin vitamin.” Many scientific workers have expressed doubt as to the desirability of terming this body a vitamin. Others have upheld the use of the term. From the practical point of view, the question of nomenclature is of minor importance. Though inconclusive, the opinion of manufacturers who have already used vitamin F seems on the whole to be favourable, especially where it has been employed in association with other actual skin ingredients, namely, lecithin and cholesterol.

Technical improvements in soap manufacture relate in the main to the production of better-quality soap flakes and soap powders—products that, owing to their convenience and ready solubility, are steadily replacing the older bar soaps.

The most notable feature in the manufacture of perfumery and toilet waters is the increasing use of synthetic chemicals, as opposed to flower oils and other natural materials. Undoubtedly the chief developments over the past year are the synthesis of jasmone (characteristic constituent of natural jasmine), and the widespread use in high-grade perfumes of “heady” products of the cyclopentadecanone series.

On the business side, the chief event in the U.S.A. has been the increase of Federal control, prohibiting false advertising and unfounded claims. In Great Britain the soap makers’ association and the perfumery, etc., section of the London chamber of commerce have made good headway in meeting trade problems.

The leading world producers of soaps, perfumes, and cosmetics are U.S.A., Great Britain, France, and Germany. The industry is fast developing in South Africa, Canada, and Australia. Official production statistics are as follows: U.S.A.; \$308,000,000; Great Britain, \$131,275,000; while the total amount actually spent by the public on hair waving, beauty treatment, toilet preparations, etc., is approximately four or five times as much as these figures indicate. (F. V. W.)

**Soccer.** New York Americans triumphed in the concluding series of the national challenge cup competition to become soccer champions of the U.S. Football Association for the 1936–37 season. After dropping the first game to the Shamrocks at St. Louis, 1–0, the Americans gained a 4–2 victory at New York to win the two-game total-goal series by the combined score of 4 to 3. Approximately 5,100 were in attendance at St. Louis and a capacity crowd of 6,000 in New York. In the Eastern final the Americans were beaten, 2–0, by the Brooklyn Hispanos, but on their own field the New Yorkers won, 3–0, to take the round by 3–2. The Shamrocks defeated the Chicago Spartas, 3–1, in the first game of the Western final at St. Louis, and as neither team was able to score at Chicago the total for

the two games remained at those figures. Trenton Highlanders, Eastern regional champions, won the National Amateur Cup defeating Castle Shannon, 1–0, in the deciding game at Pittsburgh, Pa. There was a slight increase in the number of colleges playing soccer, and there seems to be a definite trend toward improvement in playing skill. (See also FOOTBALL: *Great Britain*.) (J. B. P.)

**Social Credit** was adopted by Mr. William Aberhart, Premier of the Province of Alberta, Canada, from the monetary theories of Major C. H. Douglas, who claims that business crises are caused by lack of purchasing power (money). Under the proposed Alberta social credit plan, this deficiency of purchasing power is to be remedied by issuing to each citizen a “basic dividend” of \$25 per month in non-negotiable certificates. These certificates are blank forms to be filled out by a debtor in favour of a creditor; the recipient must then deposit the certificate with a bank or Provincial credit house, where the amount of the certificate is placed to his credit. The natural resources of the Province, called “Cultural Heritage” are the credit on which these certificates are to be issued.

A price control system is to be introduced to fix a “just” price at which goods and services are sold together with a turnover tax. For example, it is suggested that the just price for wheat should be sixty cents a bushel to the grower. A tax of five cents would be levied on each bushel at the time of sale. When the grain is converted into flour an additional tax, and when the flour is made into bread still another tax. In this way it is hoped to recover the amount paid out in basic dividends.

Up to Jan. 1, 1938 the plan had not been put in operation. An attempt to issue scrip called “Velocity” dollars has also been abandoned. (See also ABERHART, WILLIAM; ALBERTA.) (J. T. C.)

**Socialism.** The Socialist movement in the United States and Europe in 1937 gave much attention to means of combatting trends toward fascism and war in their respective countries and in the world at large.

In the United States, the Socialist party actively participated in the movement for the formation of State and national labour and farmer-labour parties and in trade union organization campaign. At the party’s Chicago convention in late March, the delegates present, in their labour party resolution, declared that “the great awakening of the workers requires as its logical next step the definite development of independent working class political action” and instructed party members “to give all possible support to the proper formation of such a party on a national scale.” They urged vigorous support for the industrial union policy of the C.I.O., while appealing for unity in the ranks of labour. They outlined a program for avoiding war and maintaining civil liberties, for aiding the Spanish Government, improving agriculture and building consumers’ co-operatives.

Members of the Socialist party took a leading part during 1937 in the Wisconsin Farmer-Labor Political Federation and in the campaign in behalf of a labour slate in Detroit and other cities. In New York city the Socialist party supported numerous independent candidates of the American Labor Party in the fall elections.

The Social Democratic Federation, a Right Wing Socialist organization, held a convention in Pittsburgh in May, 1937 and adopted a program of organization and action. In the November elections, the chairman of the Federation, Jasper McLevy, was re-elected mayor of Bridgeport, Conn., by a vote of 28,526 to 8,969 for his nearest opponent.

In England, the British Labour party began its year’s activity with the issuance of a new manifesto, “Labour’s Immediate Pro-

gram," which included demands for social legislation and the nationalization of banking, coal, power and transport. The party during the year, under the leadership of Herbert Morrison, won sweeping victories in London and in other municipalities. As a result of the November municipal elections, Labour became the major party in 57 of the 130 large town councils of the country. At its October Congress, the Labour party voted not to oppose the government's rearmament program, reversing its former stand. It reaffirmed its solidarity with the Loyalist government in Spain, and increased the representation of the branches of the Labour party on the Executive Committee from 5 to 7. George Dallas was elected the chairman of the Executive. Stafford Cripps and Harold J. Laski were elected to the Executive as the additional representatives of the party branches.

On the continent of Europe the government of Léon Blum, leader of the French Socialist party, came to an end on June 21, following the refusal of the Senate to give the premier full power to handle the financial issue. A few days later Blum became vice-premier in the Chautemps Government. The French Socialists in November suspended unity negotiations with the Communists, as a result of a bitter attack on Socialists made by the secretary of the Communist International, Dimitrov. Many Socialists vigorously criticized the government for enforcing an embargo on war materials destined for the Spanish government.

In Spain the year was devoted primarily to resistance to the rebel forces under Gen. Franco. Caballero, the Left-Wing Socialist leader, resigned from the premiership on May 15, and was succeeded by the moderate Socialist, Juan Negrin, who organized a "win the war" cabinet. The new cabinet contained three Right-Wing Socialists, including Prieto, leader of the party, two Communists, two Catalan Leftist Republicans, one Catalan Nationalist and one Basque Nationalist. The Anarchists were excluded from participation. Much friction existed throughout the remainder of the year between the government and the General Union of Workers—the C.G.I.—of which Caballero was the general secretary. On Jan. 5, 1938, Caballero resigned that position. The new Executive adopted a program of full co-operation with the Government.

In Belgium, Emile Vandervelde, leader of the Belgian Labour party, resigned as minister of health in the Van Zeeland cabinet in early 1937 during a dispute over the government's "sharp" note to the Spanish government. Paul Spaak and Henri DeMan, leading Socialists, remained in the cabinet as foreign secretary and minister of finance. Arthur Wauters, Socialist, was appointed to Vandervelde's place. In the by-election in April, the Belgian Socialists supported Van Zeeland against his Rexist opponent.

The Finnish Social Democratic party, during the early part of the year, entered the nation's Cabinet for the first time in a decade. As the strongest party in the country, it was allotted 5 out of the 12 Cabinet seats. The Norwegian Labour party was signally successful in the municipal and rural elections of October. In Europe as a whole, the Socialist, Labour, and Social Democratic parties ended the year as the largest parties in the three Scandinavian countries—in each of which the premiers were Socialists—in France, Spain, Switzerland, Czechoslovakia, and Finland. They constituted the second largest political groups in Great Britain and Holland. (See also LABOUR PARTY; SOCIALIST PARTY.)

(H. W. L.)

**Socialist Party** entered the year 1937 numerically at low ebb but active in labour's mass organization drive, especially in the C.I.O. The party campaigned actively under the leadership of Norman Thomas and George Nelson, candidates respectively for president and vice-president, in 1936 with no expectation of holding its vote of 1932, much less

of becoming the mass labour party in the political field, the establishment of which it greatly desires. The reason for the campaign was that the party believed that under the conditions existing in America only so could the real issue, Socialism versus Capitalism be kept in the minds of the people and socialist educational work in the fullest sense of the term be carried on.

The party in 1936 lost over organizational and doctrinal issues a considerable part of its right wing. The secessionists formed the Social Democratic Federation and most of them supported Roosevelt in 1936. The party gained in 1936 and 1937 some hundreds of Trotskyists whom, however, it was obliged to expel in Sept. 1937 for disloyalty and for disruptive activities. At its conventions in 1936 and 1937 the Socialist party took a generally leftist position and especially declared its opposition to "collective security" as a possible or desirable road to peace in the capitalist-nationalist world.

American socialists are willing to co-operate with all working class groups, especially in the trade union field. But they are opposed to the Communist personal party dictatorship in Russia and Communist opportunism in America. Socialists seek to work out and to gain acceptance of terms on which they can work within genuine local and State labour parties in election campaigns while maintaining their party's identity and organization for all other work. In line with this policy the party supported the labour ticket in Detroit and had a partial electoral agreement with the American Labour party in the New York municipal election. For Great Britain see LABOUR PARTY. (See also SOCIALISM.)

(N. T.)

**Socialist Soviet Republics:** see UNION OF SOVIET SOCIALIST REPUBLICS.

**Socialized Medicine.** Socialized medicine connotes a form of medical practice in which the method of distributing medical care is made subject to the uses or influences of groups of persons, the community, or the state. The terms "social medicine," "state medicine," "public medicine," "sickness insurance," and "socialized medicine" have been used to describe certain forms of medical practice since the latter part of the 18th century. These terms, although not synonymous, have too frequently been used interchangeably by most writers.

"Social medicine" properly means study and research devoted to the interrelation of disease with social and economic conditions. In America this concept is often confused with various social actions concerned with medical practice: e.g., medical care plans for the poor or medical social work. The field of social medicine, however, has to do with the interdependence of the science and practice of medicine with social developments such as movements of population and flow of commerce.

"State medicine" pertains to the attempts of government, through salaried employees, to provide medical services directly to individuals in the general population. The only example of a national system of state medicine is in Russia where the system has not completely supplanted other forms of medical practice.

"Public medicine" includes those arrangements whereby government provides medical services to special groups of persons and undertakes activities which may be applied en masse for the protection of the health of the entire population. These latter activities are commonly designated "public health." Special groups which receive medical care under Government arrangements are: the Army and Navy; persons requiring institutional care for mental diseases, leprosy, tuberculosis, and communicable diseases; epileptics; the feeble minded; veterans with service-connected disabilities; criminals; and those who are wards of the

Government, such as Indians. The United States Public Health Service and State, municipal, and county health departments are governmental agencies which in their respective jurisdictions are concerned with educational, preventive, and enforcement measures for the protection and betterment of the public health.

"Sickness insurance," also called health insurance and social insurance, is ostensibly a method of distributing the economic burden of sickness. Primarily it does seek to relieve the financial losses from unemployment due to illness, but inevitably it has concerned itself with the management of the medical services necessary to return the sick person to employment. Under sickness insurance, the Government, or agencies authorized by the Government, collects funds by payments from individuals and by taxation to provide designated medical services. These services are rendered only to insured persons by physicians who signify their willingness to practise medicine under the conditions and payments established by the system.

"Socialized medicine" is a much broader term than any of the foregoing, and includes all methods of providing medical services whereby physicians are paid with funds collected from groups of individuals or with funds established by philanthropy or by taxation. Examples of existing arrangements of medical practice which can be considered as tending to socialize medicine are industrial medical systems; medical and hospital benefit organizations; mutual benefit associations; trade union, fraternal or lodge and group practice plans; community health associations; student health services; outpatient departments of hospitals; clinics; and medical service plans of county medical societies—all of which enable members to receive medical services without directly paying the physician or being required to pay at all.

All of the concepts of medical practice arrangements here mentioned are in contrast with the "private practice of medicine" whereby individual persons voluntarily select and pay personal physicians to render preventive and curative medical services.

Medicine, in the broad scientific sense, recognizes the existence of factors which affect health, and seeks to apply the accumulated knowledge in medicine to prevent or remove the effects of these factors. Medical knowledge is made available to individuals through many forms of medical and health facilities. The value and efficiency of these facilities are influenced greatly by methods of organization and distribution. Methods of socialization which disturb the close, direct, personal, confidential relationship between the individual and the physician of his choice, which fail to incite initiative and continued medical education for the practising physician, or which place the control of medical practice in the hands of non-medical persons all operate to lessen the quality of the service rendered. (See also UNITED STATES: *Socialized Medicine*.) (R. G. L.)

**Social Legislation:** see STATE LEGISLATION: *Social Legislation*.

**Social Security.** The varied program embodied in the Federal Social Security Act approved on Aug. 14, 1935, approached almost legislative completion in 1937. Of the many systems set up by the act only one—the old age insurance plan—requires no complementary State legislation.

With the enactment of 15 new laws early in 1937, all American States and territories placed unemployment insurance laws on the statute books. Unemployment benefits were paid during 1937 only in Wisconsin. From August, 1936 to the end of July, 1937 this State paid a total of \$1,080,000 to 52,667 unemployed workers, an average of \$20.50 to each beneficiary for the year. By November 30, \$1,887,000 were distributed among 70,000 beneficiaries. Thirty jurisdictions are due to start benefit payments

to unemployed workers in 1938.

With the enactment of seven new laws in 1937 providing assistance for the needy aged, 47 States, the District of Columbia, and the territories of Alaska and Hawaii have placed such legislation on their statute books. Only Virginia was without such a law last year. At the end of September, 1937, there were 1,469,998 old age assistance recipients as against 862,402 during September, 1936. While the average payment per recipient for the whole country that month amounted to \$18.97, the grants varied greatly in the different States. The range was from \$4.39 in Mississippi to \$40.06 in Colorado. The ratio of recipients to population also continued to vary greatly in the different States. Whereas Tennessee paid grants to only 38 persons out of every 1,000 persons 65 years of age in that State, Oklahoma was making grants in September, 1937 to 589 persons out of every 1,000 of its aged population.

The applications for social security account numbers for the Federal old age insurance system totalled over 34,500,000 by the end of September. Employer applications for identification numbers reached nearly 3,000,000 by the same period. Although it was estimated that about 320,000 persons, or their estates, would be entitled to the lump sum payments provided under the old age insurance features which pay 3½% of the wages earned since Jan. 1, 1937 by an insured person who dies or reaches the age of 65, only about 27,000, or less than 10% of the expected number made such claims by the end of September. Close to 20,000 of these claims were certified for payment by the same period. The balance in the old age reserve account in the U.S. treasury amounted to \$766,899,001.85 as of September 30.

By September, 1937, 39 measures for dependent children were approved by the Social Security Board. These systems provided assistance for 193,991 families covering 481,734 children. The average payment per family in Sept. 1937 was \$30.64 with the range in individual States from \$10.39 in Arkansas to \$57.42 in Massachusetts. Here also the ratio per population varied greatly in the different States. Whereas in South Carolina only two children out of every 1,000 under 16 years of age in the State were in receipt of benefits, the State of Maryland paid such benefits to 38 children out of every 1,000 under 16 years of age.

Plans for assistance to the blind were approved by the Social Security Board in 35 jurisdictions by September, 1937. A total of 39,028 persons were in receipt of such help at an average of \$25.87 per month. The variation here was also great. Individual average payments ranged from \$9.06 in Arkansas to \$47.74 in California. Also as against one blind person per 100,000 total population receiving aid in the State of Kansas, 106 persons per every 100,000 population were receiving such aid in Pennsylvania.

Although in 1937 there developed a great deal of criticism against many of the provisions of the Social Security Act, no changes in the act were made by Congress during that year. The chief criticisms were centred around the old age insurance plan, especially the huge reserve system contemplated. The reserves were denounced as unnecessary because a social insurance program, being radically different from a private insurance plan, does not require reserves. They were also attacked as financially unsound. The present reserve system was especially criticized as socially vicious because the funds are derived almost exclusively from direct and indirect taxation on the wage and salary earners which tends to decrease the purchasing power of the masses, thereby curtailing production, increasing unemployment and enhancing insecurity. The inadequate benefits provided during the next generation under this system were also bitterly assailed. Official recognition of the criticism of the old age insurance plan came during May when the U. S. Senate Finance Committee and the Federal Social Security Board appointed an Advisory Council,

composed of 24 representatives of labour, employers and the general public, to study the practicability and advisability of retarding the increases in the present taxes, of increasing and hastening the payment of benefits, and of either reducing or doing away with the reserve system. The Council began its studies late in 1937. For national insurance in Great Britain and Northern Ireland *see* NATIONAL INSURANCE. (See also RELIEF; SOCIAL SERVICE.) (A. EP.)

**Social Service.** The outstanding events of the year 1937 in the field of social service in the United States were connected with the implementing of the Public Assistance and Social Insurance provisions of the Federal Social Security Act and the further development of the rapidly growing public social services in the various States.

The relief needs of the people continued to be very great, and, during the late autumn and early winter, the increase in the number of unemployed created a grave situation, particularly in the urban industrial centres. The needs of the unemployed and of the so-called "unemployables" on relief were probably met less adequately than in any year since 1932. In place of the old Federal Emergency Relief Administration with its large funds for grants to the States for direct relief and work relief, Federal aid for relief was provided only through the Works Progress Administration. This work program, however, did not provide for all of the employable men and women certified by the relief authorities as "in need," and the care of the remaining "employables," in addition to the so-called "unemployables" (the acute and chronic sick, the mentally and physically incapacitated) was left to the States and minor local authorities. Since many of these local governments were unable, and some of them unwilling, to carry this burden adequately, there was a sharp reversion in many areas to the conditions that existed in 1932-33, and an increasing demand that the Federal government must not only support the work program, but that a Federal grant-in-aid for direct home assistance must also be provided.

The relief situation was mitigated by the removal of a large number of families and individuals under the three important public assistance services under the Social Security Act. Steady progress was made during the year in the adoption of the Federal program by the different States. In the forty-three States in which there were regular sessions of the State legislature, various steps were taken to provide the necessary legislation to enable States to qualify for the Federal grants-in-aid under the Social Security Act, for old age pensions, for aid to dependent children (mothers' pensions), and for aid to the needy blind (blind pensions). All of this assistance was financed jointly by the Federal and State governments, assisted, in most States, by the minor local governments. The Federal, local, and State governments together provided during the first ten months of the year 1937 approximately \$250,000,000 for old age pensions, \$48,000,000 for aid to dependent children, and \$8,700,000 for blind pensions, or, in ten months, a total of \$306,000,000 for these three forms of public assistance.

During the year, there was also further progress in the adoption by the States of three other important services provided under the Social Security Act, but administered by the U.S. Children's bureau, which was granted \$1,500,000 to assist the States in setting up proper child welfare services; \$2,800,000 to assist the States with grants for the care of crippled children, and \$3,800,000 for State grants for maternity and infant care. The new Federal Social Security program also made available \$8,000,000 for additional services by the U.S. Public Health Service.

In 18 different States, statutes were passed providing for some reorganization of the State welfare departments; and, in addition,

various other States provided for some changes in the methods of administration of the welfare program. In New York, some important legislation of the preceding year was in process of being implemented, and on July 1, 1937, the Temporary Emergency Relief Administration, which had been in charge of New York State relief funds since September, 1931, ceased to exist as an independent administrative organization and was merged with the New York Department of Social Welfare.

Other important results of the legislative grist of 1937 in the field of social service include the new Michigan State Department of Public Assistance, the Missouri State Social Security Commission, and, most important of all, the important reorganization of the public welfare services in the State of Washington, in which a central State authority was given charge of the whole social service program, including unemployment insurance, the employment service, public assistance (relief), as well as the traditional welfare services, such as old age pensions, blind pensions, and the child welfare services, including aid to dependent children (mothers' pensions). In the state of Pennsylvania, the old poor boards representing the old type of "pauper" relief administration, were abolished by statute and a new State Department of Public Assistance created.

The President transmitted to Congress in February, 1937, the report of his committee on Administrative Management in the Government of the United States (re-organization of the executive departments), which recommended a new Federal department of social welfare. Although bills were introduced in both the Senate and the House of Representatives to carry out this recommendation, no final action was taken by the Congress. (See also SOCIAL SECURITY.) (E. AB.)

**Great Britain.**—More than £500,000,000 are spent annually in Great Britain on what are described as social services, but this total may be misleading, as it includes the cost of such services as unemployment insurance, housing, and poor relief. It is probable that what are usually regarded as charitable social services, such as the care of cripples, the deaf, the dumb, the blind, and the aged, cost more than £150 millions. The Board of Education keeps a strict control on the curricula and training of all special schools, whether maintained by public funds or by voluntary organizations dependent for their finances on public subscriptions. The board's latest report shows that there were in mid-1937 71 schools of various types for 4,585 blind children; 47 schools and training establishments for 4,544 deaf children; 160 for 16,542 mentally defective children; and 612 for 58,369 physically defectives, including cripples. Training in these schools usually ceases at the age of 16, but there has been a consistent development of institutions for the training and employment of the blind after leaving school, and in most cases these institutes are helped financially by local authorities. Blind persons are entitled to an old-age pension at the age of 50, but it is planned to reduce this age to 40 within the next year, because of the difficulty of training. At the end of 1937, there were 69,378 blind persons in England and Wales; about 26,000 are in receipt of old-age pensions at a cost to the State of £650,000 annually.

One of the most rapidly developing social services in Britain is the provision of open spaces and playing fields in and around crowded areas. Loans amounting to £3,196,002 were sanctioned by the Ministry of Health in 1936-37 for public parks, recreation grounds, and playing fields, including £1,952,270 for the purchase of land. The corresponding figures for 1935-36 were £2,467,245 and £1,109,889. The area purchased in 1936-37 was 9,059ac.; in 1935-36 4,732 acres. In addition 3,570ac. were acquired under the Local Government Acts for the benefit, improvement, and development of towns at a cost of £736,096. More than 500ac. were presented during the year to local authorities for the National

**STEALING THIRD BASE** in a girls' match game of softball, which now has 3,000,000 players in the U. S.

Playing Fields' Association. Further progress has been made with the reservation of recreation areas, and a "Green Belt" around London. The London County Council, under its scheme for assisting other councils purchasing land for this purpose, has approved areas amounting to approximately 35,000ac., and made provisional offers of assistance amounting to nearly £2,000,000.

State and municipal aid have been given to housing. The number of houses built since the Armistice up to March 31, 1937, was 3,328,398, of which 932,824 were built by local authorities, 423,723 by private enterprise with State assistance, and 1,971,851 by private enterprise without assistance. The total figure of houses built since the War represents the rehousing of roughly one-third of the population of England and Wales.

In both slum clearance and overcrowding, the local authorities have been helped by voluntary housing associations, who receive Exchequer subsidies. Thirty-three housing associations have been responsible for the building of 3,695 houses, mainly in the Greater London area. (VI. BR.)

**Societies:** see under specific name.

**Society of Glass Technology:** see GLASS.

**Socotra:** see ADEN.

**A SHARP LINE DIVIDES** the productive, properly used land on the left from the tract on the right where preventable erosion has been allowed to ruin the land

**Softball**, an outdoor game that is really a "take-off" on America's national game, baseball, experienced an amazing growth during 1937. Played on a smaller diamond, using a larger but soft ball and a smaller bat, the ball is pitched underhand instead of overhand. Ever since the Amateur Softball Association of America was formed five years ago, the game has spread rapidly and many sectional leagues have been formed.

Thousands of teams in every State battled for the chance to compete in the world series at Soldiers Field, Chicago, with 84 championship teams representing 43 States, and Canada competing. In the finals, the victorious Briggs Body team of Detroit, Mich., defeated the B & B Clothes team of Sapulpa, Okla., 1-0, in a thrilling championship tournament, before more than 25,000 spectators, thus winning possession of the \$1,000 William Randolph Hearst trophy for 1937.

The women's softball championship team representing the National Screw and Manufacturing Co., of Cleveland, Ohio, was considered to be the leading feminine club in the tournament. It played through the series to down the Rayls of Detroit, 6-1, establishing a repeat victory, the first in the history of either the men's or women's divisions. Of many city championship contests held all over the U.S., one of the most exciting was the game played for the title of St. Louis, Mo., which was won by the Navy Post team of the American Legion. The softball team of the New York Athletic Club was one of the leaders. (J. B. P.)

## Soil Erosion and Soil Conservation.

Soil conservation and the prevention of erosion is becoming a matter of public concern in many countries of the world. Although scientists had been studying the matter of soil deterioration for many years, and admonishing their countrymen against the evil day when it would be too late to take remedial action, scant attention was given to the warning by people generally while land was plentiful and expansion seemed unlimited. Then, too, because of well-distributed rainfall, infrequency of torrential rains, and careful husbandry, soil erosion is not now and never has been a critical problem in Western Europe, until recently the seat of leadership in agricultural science, except in parts of Italy and Spain, and a few other localities such as those lands in the valley of the Rhine used for crops under the protection of walled terraces.

A SPECIALLY-DESIGNED LISTER that plows furrows, with dams at intervals of every four feet, to conserve rainfall

Public consciousness in the more spectacular phase of the problem, soil erosion, began to awaken in the United States, Canada, Australia, and elsewhere about 1925. In America, the recent dust storms associated with the unprecedented drought in the American plains along with severe floods in the Ohio and Mississippi basins, served to bring the associated problems of rural land-use and flood control into still sharper focus during the past three years. Outside of Britain itself, erosion is more or less a problem throughout the British Empire, varying in kind and degree. In Australia wind does the greatest damage, while in Northern India water erosion is serious. In many of the individual States, special governmental committees have been appointed for dealing with the problem through reforestation, controlled grazing, fire protection, and especially through emphasis on good husbandry.

In the United States during 1937 soil erosion, on the whole, has likely been less severe than in the previous few years, due to better distribution of rainfall in both humid and semi-arid regions and to important public measures taken to improve agricultural practices and prevent erosion. In the Soviet Union the problem is receiving much more attention than formerly, but no comprehensive reports are available as to its relative seriousness and extent. Reports from South Africa, East Africa, Ceylon, Northern India, and some other areas leave the impression that the problem is becoming increasingly serious. In these countries an increasing population, coupled with increased pressure for crop production without a corresponding improvement in husbandry, is leading to increased erosion. China has already suffered from this sequence of circumstances, especially in the northern loessial areas.

Probably the United States has taken more tangible steps toward the control of soil erosion than most other countries. The Department of Agriculture has greatly increased its efforts in calling the attention of its citizens to the problem, in conducting demonstrations on a small watershed basis in several parts of the country, and in developing a system of subsidies for those farmers practising good husbandry. One additional Federal agency, the Tennessee Valley Authority, is making a co-ordinated attack on the whole problem of water and land conservation in a great watershed.

## SOLDIERS' BONUS—SOMALILAND

The most significant trend in dealing with the problem is the development of techniques for co-operation, first among the people on the land, and then between these people and the research and administrative agencies of the State dealing with the land. Since many of the fundamental causes of soil deterioration are due to economic and social conditions, the solution of the problem calls for economic adjustments as much as for physical improvements in husbandry. Soil erosion is an evidence, rather than a cause, of a lack of adjustment between the people and the land. In many instances farmers and ranchers cannot improve their practices without help and especially without the incentive associated with security of tenure.

During the years since the World War, a good deal of useful legislation has been enacted in several countries in order to enable farmers to adopt better practices and to safeguard the State's interest in the land and its productivity. Some of this legislation is definitely experimental and different countries, having different soils and unique problems, will need special laws. Much more can be done. Some people in the countries where erosion is serious feel that compulsory measures may be necessary to force occupiers of the land to protect it. On the whole, however, it is felt that the erosion problem needs more clarification through research before detailed regulation is attempted. These trends are emphasized in reports from all parts of the world.

**BIBLIOGRAPHY.**—Reports of the Imperial Bureau of Soil Science, Harpenden, England. 1938 Yearbook of the United States Department of Agriculture (in preparation). Charles E. Kellogg, Ph.D., Principal Soil Scientist and Chief, Soil Survey Division, U.S. Department of Agriculture, author of *Development and Significance of the Great Soil Groups of the United States*, *Soil Survey Manual*, etc. (C. E. K.)

**Soldiers' Bonus:** see ADJUSTED COMPENSATION.

**Solomon Islands:** see PACIFIC ISLANDS, BRITISH.

**Somaliland, British.** A British protectorate in east Africa, bounded N. by the Gulf of Aden, and marching with Italian Somaliland, Ethiopia, and French Somaliland. The governor is Major Sir A. S. Lawrence, K.B.E., C.M.G., D.S.O.; and the capital is Berbera, the governor's seat being at Sheikh. The area is c. 68,000 sq.mi., and the population c. 344,700, of whom (1931 census) 68 were Europeans. The religion is Mohammedan. The Somalis have in the past opposed secular education. Small grants have been made to Koranic schools, and there is one government elementary school in Berbera.

On Jan. 27, 1937, an agreement was signed in Rome between Great Britain and Italy settling various matters affecting the interests of the two countries in their respective areas in

SOIL OF THIS SLOPING FIELD did not wash away because the basin-listed furrows, plowed on contour, held the water until it could be absorbed

Somaliland, including the organization of transit traffic and tribal grazing and watering rights in Italian territory.

There is a weekly steamer service from Aden. There are no railways, and the 2,000 mi. of roads are liable to become impassable in certain seasons. There is a telegraph system, and 5 wireless stations. In 1936, 1,301,419 hides and skins of sheep and goats were exported, and 11,938 cwt. of gum and resin. Total exports for 1936 were Rs. 2,605,596, and imports Rs. 5,669,801. Banking business is conducted through an Aden branch of Messrs. Cowasjee Dinshaw Bros., and the currency is the Indian rupee. Revenue and expenditure for 1936 were £164,536 and £207,190 respectively.

**Somaliland, French,** is a French colony on the east coast of Africa, lying between Eritrea and British Somaliland. Area c. 8,490 sq. mi.; population c. 70,000, including 700 Europeans. Capital, Jibuti. The railway from Jibuti to Addis Ababa has increased considerably in importance as the result of the Italian annexation of Abyssinia, for the Italian troops have largely depended for their existence upon transport on this line. A provisional agreement was reached between the French railway company and the Italian administration on the subject of transport tariffs. The Italians are trying to find other methods of penetration, whether by road or by rail; but Jibuti remains the natural outlet for Abyssinia, and its importance continues to increase.

**Somaliland, Italian,** a coastal strip of N.E. Africa, on the Gulf of Aden (N.) and the Indian ocean (E.), backed by British Somaliland, Ethiopia, and Kenya, and now forming part of Italian East Africa (*q.v.*): area, about 195,800 sq. mi.; pop. (1931) 1,021,570, including 1,670 Europeans. Mogadiscio is the capital and seat of the governor.

The chief products are oil, gum, hides, kapok, sugar, cotton, and ivory, and the colony is the source of half the world's supply of incense; bananas and maize are also grown. In 1934 imports amounted to 59,190,960 lire and exports to 30,290,390; in 1935-36 the budget balanced at 70,750,000 lire. A severe drought in 1937 followed by a plague of locusts added to existing difficulties caused by the Italian occupation of Ethiopia, and brought about a shortage of food, clothing, and other supplies.

**Somervell, Sir Arthur** (1863-1937), British musical composer; born at Windermere, June 5. He was educated at Uppingham, and at King's college, Cambridge, where he took his Mus.D. in 1904. From 1894 to 1901 he taught at the Royal college of music, and afterwards became an inspector, and ultimately chief inspector, of music to the Board of Education. He was knighted in 1929. He was known chiefly for his songs, and notably for settings of lyrics from *Maud* and *The Shropshire Lad*; but his cantata, *The Forsaken Merman*, and his symphony in D minor, *Thalassa*, are among his more ambitious work which holds the attention of music-lovers. He died May 2, 1937.

**Songs, Popular.** The popular song, now recognized as the modern representative of primitive folk-music, has shown several interesting developments during 1937. The type of interpretation known as "swing" is treated elsewhere. (*See JAZZ.*) Aside from this immensely popular form of arrangement, it has been proved that popular songs could reach an enormous public without any assistance from films or stage productions (although inevitably associated with radio), that foreign importations could win as great a success in America as the native product, and finally that the novice now has greater opportunities

in the field of song-writing than ever before.

Of the fifteen leading popular songs of 1937, judged entirely by the sales of sheet music, only one was a "production number," *Little Old Lady*, the contribution of Hoagey Carmichael and Stanley Adams to the musical show, *At Home Abroad*. Three appeared in films, *September in the Rain*, *Moonlight and Shadows*, and *That Old Feeling*. The rest were all independently published and made their way through the various "plugs" originating in the legendary Tin Pan Alley and through the honest enthusiasm of the average listener.

The biggest sellers were *When My Dreamboat Comes Home*, a simple arrangement of the bugle tones, suggesting both *Taps* and the *Pilgrims' Chorus*, and Billy Hill's *Chapel in the Moonlight*, a variant of the rhythmic pattern already popularized by Franz Lehar in *My Little Nest of Heavenly Blue*. Both of these came close to the half million mark, which is now considered the limit for any popular song, as compared with sales of over two million in the past.

The rest of the "first fifteen" were *Boo Hoo, It Looks Like Rain*, *Sailboat in the Moonlight*, *So Rare*, *Harbor Lights*, *My Cabin of Dreams*, *You Can't Stop Me from Dreaming*, *Once in a While* and *Vieni, Vieni*. Of these the last named came directly from an Italian folk-song, with echoes of Verdi's *La Donna e Mobile* while *Harbor Lights* was imported from England. Another successful importation was *Serenade in the Night*, also of Italian origin.

Three of the hit songs, *So Rare*, *Cabin of Dreams* and *Once in a While*, introduced such new names as Jack Sharp, Jerry Herst, Al Frazzini, Nat Madison and Michael Edwards. Publishers in general have shown a tendency to give the amateur song-writer a chance, even to the extent of approving a clearing-house for such material and thus eliminating the traditional accusation that Tin Pan Alley is a "closed corporation."

The screen definitely made a success of *Sweet Leilani*, written by Harry Owens of Honolulu, and appearing in the film, *Waikiki Wedding*. In many cases a good song helped a motion picture rather than vice versa. Radio continued its frank admission that commercial programs are absolutely dependent on new popular songs, while the publishers took advantage of such quick publicity, even at the expense of a longer life and a wider sale of sheet music.

Dances like the "Big Apple" flourished, with a variety of music, and there was a strong movement toward the revival and re-arrangement of established folk-music. An outstanding novelty song was *The Merry-go-round Broke Down*, following the lead of the *Organ Grinder's Swing*. At the close of the year, the Yiddish *Bei mir bist du schoen* leaped into an instantaneous success. Its composer, Sholom Secunda, sold his tune outright for \$15. (S. SP.)

**South Africa, The Union of.** This self-governing dominion of the British Commonwealth of Nations extends from the southernmost point of the African continent to the course of the Limpopo, with the exception of the territories of Basutoland, Swaziland, and Bechuanaland, which remain under direct administration by Great Britain. The former German colony of South West Africa is administered by the Union under League of Nations mandate. There are in effect two capitals: the seat of government being at Pretoria, and that of the legislature at Capetown. The ruler is King George VI represented by a governor-general, Sir Patrick Duncan. The national flag is orange, white, and blue in horizontal stripes, the white stripe having in its centre the Union Jack and the flags of the Transvaal and the Orange Free State.

**Area and Population.**—The combined area of the four prov-

inces of the Union (Cape of Good Hope, Natal, Transvaal, and Orange Free State), including Walvis Bay, which is administered by South West Africa, is 472,550 square miles. The population is 9,588,665 (1936 census), made up of 2,003,512 Europeans, 6,597,241 Bantu, 219,928 Asiatics, and 767,984 coloured folk. The Dutch Reformed Churches can claim 49.61% of the European and 5% of the Bantu population; Anglicans, 18.57% Europeans and 8.77% Bantu; Presbyterians 4.74% Europeans and 2% Bantu; Methodists 6.28% Europeans and 13.5% Bantu; and 4.28% of the Europeans are Jews.

South Africa is officially bi-lingual, all important papers being printed in both Afrikaans and English, and both languages being taught in the schools. The most important of the native languages are Seyosa, Zulu, Sesuto, and Sechuana. Primary education is under the control of the provincial administrations, and is free and compulsory for Europeans. There are the following universities and university colleges: the University of South Africa, with constituent colleges at Potchefstroom, Bloemfontein, Grahams-town, Wellington, and Pietermaritzburg; and the Universities of Capetown, Stellenbosch, Witwatersrand, and Pretoria. There is also a number of State technical and agricultural colleges. Education for Bantu is entirely supplied by State-aided missions. Higher education is the direct concern of the Union Department of Education. Fort Har, the native university college, prepares students for the degrees of the University of South Africa, on whose senate it is represented.

The leading cities, with 1936 population figures, are: Johannesburg 519,268; Capetown 335,371; Durban 259,647; Pretoria 128,636; and Port Elizabeth 109,824.

**History.**—Sir Patrick Duncan, successor to the earl of Clarendon as governor-general, assumed office on April 5, 1937. A bill to abolish appeals to the Privy Council, promoted by the Nationalist Party, was defeated in January. Three by-elections took place during the year, at Yeoville, Vrededorp, and Klerksdorp, but no change in party representation occurred, the first and third being won by the United Party, the second by the Nationalists. In June the first purely native elections took place in the Cape province, three new and additional members (one a woman) being elected to the House of Assembly to represent the native voters under the provisions of the new Native Representation Act. The Natives Representation Council, an advisory body which is to consider all proposed native legislation and all estimates of income and expenditure affecting natives before they are placed before the Union parliament, composed of 15 elected members, with the five chief Native Commissioners and the secretary for Native Affairs, met for the first time in December. The defence plans of the Union received much attention during 1937; the year witnessed the inauguration of a scheme to train 1,000 air pilots in five years, and in February it was announced that 100 military aeroplanes were to be supplied to the Union by the British Government. The Union Government signed a contract with Imperial Chemical Industries, Ltd. to build a factory at Pretoria capable of supplying 10,000,000 rounds of ammunition annually, and a scheme for making the Union self-sufficient regarding armament supplies was examined. A national physical training scheme, with 300 to 400 trained instructors, is under consideration. The proposal to transfer to the Union the native protectorates of Basutoland, Bechuanaland and Swaziland came to the front after Gen. Hertzog's visit to England for the coronation: after suggesting that Britain was neglecting the Union's rights, it was realised that there had been a misunderstanding with the Home Government, and in October Gen. Hertzog announced that he had recently received a communication from the British Government bearing out his view that the transfer would shortly be effected. On July 1, on the inauguration

of the new Imperial Airways flying-boat mail service from Southampton to Durban, the Union Government started a new air mail system intended to carry all inland letter mails by air as far as possible, and including a daily service from Johannesburg to Capetown.

**Trade and Communications.**—The most important agricultural exports are maize, citrus and soft fruits, hides and skins, wool, and mohair. Wool exports for 1937 showed an increase in value of about £3,000,000 over the figures for 1936; fruit exports also rose, amounting to c. £4,000,000; and maize was exported to the value of £3,000,000, compared with £60,000 in 1936. Gold is the most important product; and the total production in the Transvaal for 1937 was 11,740,891oz., compared with 11,336,214oz. in 1936.

The production of diamonds in 1936 was, in carats, 339,718 (mined) and 284,204 (alluvial). The total value in sterling of imports and exports during 1936 are shown as follows:

<i>Imports</i>		<i>Exports</i>	
Merchandise . . . .	£81,099,318	Produce . . . . .	£109,497,485
Government . . . .	5,182,748	Re-exported. . . .	1,888,241
Specie . . . . .	22,018	Through Post . . .	134,769
	£86,304,084	Ships Stores—	
		produce . . . . .	1,188,730
		Re-exported. . . .	179,889
		Specie . . . . .	1,645,002
			£114,534,116

For the first six months of 1937, imports were £49,115,515 and exports £58,785,040, as compared with £40,902,745 and £59,235,247 for the corresponding period of 1936. Estimated 1937 figures for total imports and exports are £103,000,000 and £125,000,000 respectively.

The railways are owned and managed by the South African Government. They are efficient, and there are few areas which they do not touch. Many of the gradients are astonishing. There are some electrified lines, particularly in the suburbs of Capetown and Johannesburg and on the heavy gradients of central Natal, and extension of electrification is contemplated. At the end of March 1937 there were 13,213mi. of railway, of which 884mi. were 2ft. gauge, and the remainder 3ft. 6 in. There is through communication from Capetown to Port Francqui in the Congo. Main roads are well maintained and of good surface, but local roads are rough and often impassable at certain seasons.

On April 1, 1936, South African Airways took over the services south of Germiston formerly operated by Imperial Airways; and in June and July 1937, coincidentally with the introduction of an Imperial Airways flying boat service terminating at Durban, South African Airways took over the route from Germiston to Lusaka and finally to Kisumu, on Lake Victoria. There are also six local routes operated by South African airways: Rand-Durban daily, Durban-Capetown twice weekly, Rand-Capetown via Kimberley twice weekly, Rand-Port Elizabeth via Bloemfontein weekly, Rand-Windboek via Kimberley twice weekly, and Rand-Kisumu weekly.

Telephone communication is possible between all the large centres, and further extension of long distance lines is being considered. Farm lines are increasing, and in 1936, 15,714 farmers were served. There were altogether 1,449 exchanges in 1936.

**Finance and Banking.**—The Union mints its own currency, which is identical in denomination and value with that of the United Kingdom. Revenue and expenditure estimates for the financial year 1937–38 are £42,550,000 and £37,550,000 respectively. The income tax for individuals is graduated from 1s. to 2s. in the £; for gold-mining companies it is 3s. in the £, and for other companies 2s. 6d. There is a poll-tax on natives at a rate of £1 a head, and in addition a local tax of 10s. per hut up to £2 on all owners of huts in native Reserves.

The most important of the banks are the Government Reserve Bank, the Standard Bank of South Africa, and Barclay's Bank (Dominions, Colonial and Overseas).

**Defence.**—The Union Government is entirely responsible for the land defences of its territory. Every citizen is liable to a period of military training between the ages of 17 and 25, and a minimum of 50% of those of age are called upon. The Union defence force is a permanent force consisting of seven military commands under a Council of Defence. There is also a military college. The South African air force is of considerable strength, with two bases at Roberts Heights near Pretoria, and at Cape-town. A new system of training pupil-pilots for inclusion in the Defence Force Reserve of Pilots has lately been instituted. Pupils do non-continuous training at private aerodromes or clubs and continuous training at the training school at Roberts Heights. A small subsidy is paid by the Government towards the training of such pilots. The naval defences of the Union are the responsibility of the British navy, which maintains a station and dock-yards at Simon's Town in the Cape Province. There is also a South African division of the Royal Naval Reserve, which embraces citizens liable for service who elect to perform naval service. The Citizen Force Reserve consists of citizens who have performed their peace training. Union expenditure on defence in 1936 was £1,155,198.

**BIBLIOGRAPHY.**—E. A. Walker, *History of South Africa*, new edition, 1935; *Smuts*, By Sarah Gertrude Millin, 1936; *Africa Emergent*, W. M. Macmillan, 1938; *The Cambridge History of the British Empire*, vol. VIII. (W. M. Ma.)

**South Australia**, a State of the Australian Commonwealth, 380,070 sq.mi. in area, bounded by longitudes 129° E. and 141° E., and by latitude 26° S. and the southern coast of the continent. The State governor, representing H. M. King George VI, is Major-Gen. Sir Winston Duggan, K.C.M.G. Population (1937) 588,395, forming 8.6% of the population of Australia. Capital, Adelaide: population (1936) 316,878, including suburbs. The premier of a Liberal government is Mr. R. L. Butler.

**History.**—Parliament was opened by the governor on July 27, 1937. Among the measures passed during the year was an amendment to the State constitution prolonging the term of parliaments from three to five years, and consequently providing for the election of members of the legislative council for 10 instead of 6 years. Other bills presented to parliament provided for the establishment of a Milk Marketing Board, the application of tests to new drivers before the issue of car-driving licences, and the ratification of an agreement between the Government and the Broken Hill Proprietary Co. for the construction of a large iron-works at Whyalla.

The Mount Bold reservoir, with a total capacity of 6,662 million gallons and a height of dam of 147ft., was completed during 1937. The Municipal Tramways Trust inaugurated an experimental system of trolley-buses. A betting commission was appointed with wide terms of reference; in 1936-37 the betting turnover in the State, apart from totalizator betting, was over £7 millions, of which only £1.7 millions was laid on the course.

**Trade, Industry, and Finance.**—Production in 1935-36 was valued (gross) as follows: agricultural, £11,431,418; pastoral, £5,442,737; dairying, etc., £2,688,560; forestry, fisheries, etc., £824,585; mining, £2,700,162; total, primary industry, £23,087,862 gross value, £15,147,080 net value; factory industry, £31,904,091 gross value, £11,669,705 net value. Livestock numbered (Dec. 31, 1936) 7,905,000 sheep, 328,000 cattle, 201,000 horses, and 86,000 pigs. The percentage of trade unionists unemployed in Aug. 1937 was 8.4, the number of registered unemployed in that

month being 8,209. Corresponding figures for Aug. 1936 were 10.0% and 11,109.

The 1936-37 budget yielded a surplus of £139,168, instead of an estimated deficit of £168,452. Revenue was buoyant, but expenditure also increased. Income-tax was reduced by 3d. in the pound, at a cost of £225,000, and certain small family incomes were exempt from tax. The special grant from the commonwealth had been reduced from £1,330,000 to £1,200,000 for 1937. Wage and salary increases would cost £225,000. On the other hand, considerable increases of revenue were expected from income-tax, railways, and other sources. Total revenue for 1937-38 was estimated at £12,248,632 (against £11,739,306 received in 1936-37), and total expenditure at £12,244,648 (against £11,600,138 in 1936-37). The loan works program for 1937-38 totalled £2,800,000 gross, offset by credits of £1,500,000, being chiefly repayments of advances by the State Bank (for house-building, etc.) and by the Farmers' Assistance Board. (H. V. H.)

**South Carolina** has an area of 30,989 sq.mi., including almost 500 sq.mi. of coastal waters. Population 1930, 1,738,765 of which 944,040 were white and 793,681 were Negro. Estimated population June 30, 1937, 1,875,000. The capital is Columbia with 51,581; the only larger city is Charleston with 62,265.

OLIN DEWITT JOHNSTON, governor of South Carolina

**History.**—Extensive strikes in 1935-36 caused a conservative reaction. Support of President Roosevelt's policies continued overwhelming, although many senators and the State Bar Association condemned the proposed change in the Supreme Court. Gov. Olin D. Johnston's hostility to the highway department continued, characterized by his charges of political domination by the department and the department's resting on concrete evidence of its service. The governor's demand for removal of Chief Highway Commissioner Ben M. Sawyer was answered by the new commission's electing Sawyer for his fourth consecutive four-year term. While Gov. Johnston has roused much feeling against the commission (having in 1935 seized their offices by military force, until restrained by the Supreme Court), conservatives highly value the commission's services. The State-administered highways, June 30, 1937, comprised 6,509mi. 2,418 of which were standard paved and 1,893 of which were bitumen paved, total cost (including \$9,821,645 under construction), \$117,366,108. Johnston's pardons are far fewer than those of many governors. His criticized "leaves of absence" were 393 among over 10,000 prisoners in three years.

**Education.**—A compulsory attendance law (ages 7 to 16), with basic State financial aid, a State-supported school term of eight months, and a State guarantee of minimum teachers' pay \$75 to \$90 a month, were enacted in 1937. A law of 1936 rents text books at one-third retail price. Free text books for low grades failed in an executive-legislative disagreement.

Enactments promoted soil conservation, tax exemption at certain places for new factories, housing, forest protection. Total lack of county legislative authority continued to prolong legislative session and to show the great majority of laws of local character.

**Charities and Correction.**—Inmates of State hospitals for insane (including practically all the insane) numbered 4,757, June 30, 1937. The State penitentiary contained 1,318 prisoners on the same date. Many others of all grades are on county chain gangs.

There were during the year ending June 30, 1937, 107 homicide acquittals, 231 convictions, and five electrocutions.

**Finance.**—State revenue receipts for the year ending June 30, 1937 were \$26,623,381, and non-revenue receipts (bond sales, Federal grants, etc.) \$21,412,594. The total State debt on June 30 was \$70,825,438, of which \$63,255,000 was for highways. Highway bonds are being systematically paid from the gasoline tax of six cents a gallon and the new low car license fees. Federal internal revenues from South Carolina in 1937 totalled \$7,876,563. Federal PWA expenditures in the State 1934-36 were \$16,841,369. Import duties collected in South Carolina in the year ending June 30, 1937, \$685,020.

The cause of labour was strongly favoured by Gov. Johnston, a lawyer once a cotton mill operative. The department of public welfare, created in 1937, planned annual aid of \$4,500,000 to dependent children, the blind, the aged, etc., through State, county, and Federal co-operation. Unemployment compensation was enacted, 1936. Wages tended upward in the first half of 1937. Both the American Federation of Labor and the C.I.O. extended their efforts in the State, the latter at places gaining on the former. Several C.I.O. organizers were mobbed by workers. The State law forbidding women's work in mercantile establishments after 10 p.m. was judicially applied to restaurants.

**Agriculture, Manufactures.**—The proposed \$37,500,000 Santee-Cooper rivers hydro-electric-navigation project on Federal funds still hangs in the courts, although approved by the Federal District Court. The Buzzard Roost hydro-electric project for the Saluda near Greenwood gained Federal Supreme Court approval on Jan. 3, 1938. In December the State Rural Electrification Authority had 303mi. of line and 1,152 customers. Private companies have begun similar service. Crops for 1937 were 17% above 1936 (31% above the 1928-32 average); value, \$125,771,000 (5% below 1936; 46% above the 1931-35 average). Capital in all manufactures, year ending June 30, 1937, \$378,536,953; product, \$422,267,920; average employees, 132,128; wages (management omitted), \$95,026,602. (D. D. W.)

## South Dakota,

one of the East North Central States, admitted to the Union in 1889, is popularly known as the "Sunshine State." The area is 77,615 sq.mi. Population (State census, 1935), 675,082; (estimated July 1, 1937), 692,000. Capital, Pierre, population 4,013. Chief city, Sioux Falls, population, 33,644. Urban population 289,751. Rural population, including Indians, 385,931. Indian population 27,401.

**History.**—South Dakota, normally Republican, became wholly Democratic in 1934. At the elections of 1936, Republicans placed in office a governor, a lieutenant-governor, one congressman, and captured both houses of the State legislature. The leading State officials are: Leslie Jensen, R. governor; Goldie Wells, D. secretary of State; Donald McMurchie, lieutenant governor; Raymond A. Kelly, State auditor; W. H. Hinselman, State treasurer; and Clair Roddewig, attorney general. The chief legislative act in the year was a system of old age pensions. In the election of 1936 five consti-

LESLIE JENSEN, governor of South Dakota

tutional amendments prevailed aiming to remove educational officers from politics and taking off limitation of terms of service; increasing liability of stockholders for losses in banks; limiting State indebtedness to .5% of assessed valuation; reducing membership of senate to 35 and house to 75 members.

**Statistics.**—The school census for 1937 showed a loss of 7,803 pupils, perhaps due to crop failures. On June 30, 1937, the State debt was \$41,208,230, a reduction of \$1,702,671 for the fiscal year. The gold production for 1937 was \$20,026,431. The total value of crops produced in 1937 was \$66,088,000. The banking situation was greatly strengthened. Six small banks were closed and at once taken over by the FDIC for liquidation. There was no loss to the depositors.

Persistent drought and grasshopper infestation oppressed agriculture and caused perceptible movement of population from farms to towns.

Manufacturing, never commanding in the industrial field, showed a recession.

The number of out-of-State tourists who visited the Black Hills was 528,000. Establishment of manual and industrial training in the State reformatory indicated improved morale among the inmates. (D. Ro.)

**Southern Rhodesia:** *see* RHODESIA, SOUTHERN.

**South Polar Regions:** *see* ANTARCTICA; ANTARCTIC EXPLORATION; EXPLORATION AND DISCOVERY: *Antarctic Exploration.*

**South-West Africa,** territory north of the Orange river, bounded on the W. by the Atlantic, on the N. by Angola, and on the E. by the Bechuanaland Protectorate and the Cape province of the Union of South Africa; formerly a German colony, but since 1920 administered under a mandate by the Union of South Africa. Area (including Walvis bay) 318,000 sq.mi.; population 360,000 (census 1936) including 31,000 Europeans, of whom in 1937 about 9,600 spoke German in their homes. The capital is Windhoek (pop. c. 19,000). The administrator, appointed by the Union Government, is assisted by an executive committee of four, and an elected legislature of 18 members.

There are four high and secondary schools, and fifty-six other government schools, besides German private schools, with about 70 mission schools for native children. Stock-raising is the main occupation of the people. There is a considerable export trade in skins and hides, and butter is manufactured; diamonds are mined, and vanadium worked in the north. There is a direct railway line from Windhoek to Capetown; the total mileage of railways is about 1,560. All mails are carried by air. Estimated revenue and expenditure for 1936-37 were £534,000 and £856,000 respectively; imports in 1936 were valued at £1,960,000 and exports at £3,121,000. Nazi activities by ex-German inhabitants led to a proclamation on April 4, 1937, restricting the political activities of non-Britishers, and making it an offence for British subjects to give allegiance to any head of a State other than the King of Great Britain.

## Sovereigns, Presidents and Rulers.

The following list includes the names of those holding chief positions in their countries on Jan. 1, 1938.

Country	Name and Office	Accession
Afghanistan . .	Muhammad Zahir Khan, King. . . . .	1933
Albania . . . .	Zog I, King . . . . .	1928
Arabia . . . . .	Abdul Aziz al Faisal al Saud, King . . . . .	1932
Argentina . . .	Gen. Agustin P. Justo, President . . . . .	1932
Australia . . .	Lord Gowrie, of Ruthven, Governor-General . . . . .	1936
	Joseph A. Lyons, Premier	

Country	Name and Office	Accession
Austria	Dr. William Miklas, President	1928
Belgium	Karl Schuschnigg, Chancellor	
	Leopold III, King	1934
	Paul Emile Janson, Premier	
Bhutan	Yigme Wangchuk, Maharaja	1926
Bolivia	Col. Germán Busch, Provisional President	1937
Brazil	Dr. Getulio Vargas, President	1934
Bulgaria	Boris III, King	1918
	George Kiosseivanoff, Premier	
Canada	Lord Tweedsmuir, Governor-General	1935
	W. Mackenzie King, Premier	
Chile	Arturo Alessandri, President	1932
China	Lin Sen, President	1931
Colombia	Dr. Alfonso Lopez, President	1934
Costa Rica	Léon Cortés, President	1936
Cuba	Dr. Federico Laredo Bru, President	1936
	Col. Fulgencio Batista, Chief of Staff	
Czechoslovakia	Dr. Eduard Beneš, President	1935
	Milan Hodza, Premier	
Danzig	Carl Burckhardt, High Commissioner	1937
Denmark	Christian X, King	1912
Dominican Rep.	Gen. Rafael Trujillo Molina, President	1930
Ecuador	Gen. Alberto Enríquez, Provis. President	1937
Egypt	Farouk I, King	1936
	Mohamed Mahmud Pasha, Premier	
Estonia	Konstantin Päts, Pro-President	1933
Finland	Kyösti Kallio, President	1937
France	Albert Lebrun, President	1932
	Camille Chautemps, Premier	
Germany	Adolf Hitler, Führer	1933
Great Britain	George VI, King and Emperor	1936
	Neville Chamberlain, Prime Minister	
Greece	George II, King	1935
	Gen. John Metaxas, Premier	
Guatemala	Gen. Jorge Ubico, President	1931
Haiti	Stenio Vincent, President	1930
Honduras	Gen. Tiburcio Carías Andino, President	1933
Hungary	Admiral Nicholas von Horthy, Regent	1920
	Koloman Daranyi, Premier	
Iceland	Christian X, King	1912
India	Marquess of Linlithgow, Viceroy	1936
Iran	Reza Shah Pahlevi	1926
Iraq	Ghazi I, King	1933
Ireland	Eamon de Valera, President	1932
Italy	Victor Emmanuel III, King	1900
	Benito Mussolini, Premier	
Japan	Hirohito, Emperor	1926
	Prince Fumimaro Konoye, Premier	
Latvia	Kārlis Ulmanis, President	1936
Liberia	Edwin Barclay, President	1931
Liechtenstein	Francis I, Prince	1929
Lithuania	Antanas Smetona, President	1926
Luxemburg	Charlotte, Grand Duchess	1919
Manchoukuo	Henry Pu Yi, Emperor Kwang-te	1934
Mexico	Gen. Lázaro Cárdenas, President	1934
Monaco	Louis II, Prince	1922
Morocco	Moulay Mohammed, Sultan	1927
Nepal	Maharaja Bir Bikram Jang, King	1911
Netherlands	Wilhelmina, Queen	1890
Newfoundland	Sir Humphrey T. Walwyn, Governor	1936
New Zealand	Viscount Galway, Governor-General	1935
	Michael J. Savage, Premier	
Nicaragua	Gen. Anastasio Somoza, President	1937
Norway	Haakon VII, King	1905
Oman	Sayid Said bin Taimur, Sultan	1932
Palestine	Gen. Sir Arthur Grenfell Wauchope, High Commissioner	1931
Panama	Dr. Juan D. Arosemena, President	1936
Paraguay	Felix Paiva, Provisional President	1937
Peru	Gen. Oscar R. Benavides, President	1935
Philippines	Manuel Quezon, President	1935
Poland	Ignace Moscicki, President	1926
	Felicien Slawoj-Skladkowski, Premier	
Portugal	Gen. Antonio Carmona, President	1926
	Dr. Antonio Salazar, Premier	
Rumania	Carol II, King	1930
	Octavian Goga, Premier	1937
Russia	Viacheslav M. Molotov, President	1931
	Joseph V. Stalin, Communist Secretary	
Salvador, El	Gen. Maximiliano H. Martínez, President	1935
Siam	Ananda Mahidol, King	1935
	Phya Phahol Sena, Premier	
Sudan	Sir George S. Symes, Governor-General	1933
South Africa	Sir Patrick Duncan, Governor-General	1936
	James B. M. Hertzog, Premier	
Spain	Manuel Azaña, President of the Republic	1936
	Gen. Francisco Franco, Insurgent Leader	1936
	Gustaf V, King	1907
Sweden	Dr. Giuseppe Motta, President	1937
Switzerland	Hashem Bek el Atassy, President	1936
Syria	Abdullah ibn Hussein, Amir	1928
Trans-Jordan	Sidi Ahmed II, Bey	1929
Turkey	Kamál Atatürk, President	1923
United States	Franklin D. Roosevelt, President	1933
Uruguay	Dr. Gabriel Terra, President	1931
Vatican City	Pius XI, Pope	1922
Venezuela	Gen. Eleazar López Contreras, President	1935
Yugoslavia	Peter II, King (Regency)	1934
	Milan Stoyadinović, Premier	
Zanzibar	Seyyid Sir Khalifa bin Harub, Sultan	1911

**Soviet Arctic Scientific Station:** see ARCTIC EXPLORATION.

**Soviet Fliers:** see ARCTIC EXPLORATION.

**Soviet Republics:** see UNION OF SOVIET SOCIALIST REPUBLICS.

**Soviet Union:** see UNION OF SOVIET SOCIALIST REPUBLICS.

**Soybeans.** Previous to 1917, the acreage of soybeans in the United States was insignificant. In 1937 a crop of 40,997,000bu. was produced from 6,989,000ac., of which 2,337,000ac. were planted for grain and 3,659,000 for hay, the remainder being otherwise used for forage or fertilizer. The U.S. Department of Agriculture gives the 1936 figures as 29,983,000bu. from 6,646,000ac., of which 2,132,000 were planted for grain and 3,251,000 for hay. The yield was 17.5bu. to the acre in 1937. In 1936 it was 14.1 bushels. The production of soybeans in Manchoukuo was 153,072,000bu. in 1937 and 152,375,000 in 1936. In Chosen it was 22,606bu. in 1937 and 19,375 in 1936. Although many new and interesting industrial uses have been developed for soybeans, and entertainingly publicized, the chief importance of the crop continues to be its value as livestock feed. Soybeans have about as wide adaptability as corn or maize. This fact has added greatly to the plant's usefulness in American agriculture, and, since soybeans are fairly drought resistant, the crop has been especially practical in recent drought years, when corn failed and soybeans were planted as an emergency crop both for cash and feed. (S. O. R.)

**Spain,** republic of south-western Europe, since July 1936 involved in a civil war, as a result of which the *de jure* government at present exercises authority in the eastern part of the country only. Capital, Madrid. Government at present established at Barcelona; Ruler, President Manuel Azaña (elected May 10, 1936); national flag, three equal horizontal bands, red, yellow, purple.

**Area and Population:**—Area: (including Balearic and Canary Islands), 196,600 sq.mi. Population (estimated 1934), 24,583,100. Density, 122 per sq.mi. Since 1931, there has been no established religion; the overwhelming majority are Roman Catholics, but all creeds are equal before the law. Spanish (Castilian), the official language, is spoken everywhere, but Catalan (in Catalonia, Aragon, and the Balearics), Galician (in Galicia and the West), and Basque (in the Basque provinces) are also in use. Elementary education is nominally free and compulsory; the 1930 census showed that some 45% of the population were illiterate. There are 11 universities. The leading cities are: Barcelona (population, est. 1934, 1,148,000), Madrid (1,048,100), Valencia (353,000), and Seville (238,750). In 1934, six other cities had a population exceeding 100,000. (X.)

**History.**—Throughout 1937 the Civil War continued, an account of which follows in the article SPAIN, CIVIL WAR IN.

At the end of 1937 the number of provincial capitals held by the Popular Front Government was 15 out of a total of 50. It was holding rather less than two-fifths of the territory of Spain, but the possession of Madrid and Barcelona, together with large refugee-immigrations, gave it a slightly larger proportion of the population.

Madrid, now strongly fortified, has remained all the year partially invested, and has suffered numerous air-raids; Valencia was the seat of the Government until October 30, when this was transferred to Barcelona. President Azaña apart from making several speeches and once visiting Madrid, has been little seen or heard. On February 1 and October 1, the Cortes held short sessions at Valencia. On May 17 Dr. Juan Negrín succeeded Sr. Largo Caballero as prime minister; his Government contained three Socialists, two Communists, and one member each

from the Republican Left, Republican Union, Catalan Esquerra, and Basque Nationalist groups. The Anarcho-Syndicalists were thus excluded, as they were also from the Catalan Government in June. In mid-October, Sr. Largo Caballero was superseded as leader of the Socialist Party by an old rival, Sr. González Peña. A few days later, Don José Asensio, under-secretary for war in the Caballero cabinet, was arrested, with three highly-placed officers, on charges arising from the fall of Málaga in February.

The Popular Front now has an efficient, disciplined army, and the morale of both army and people is high. Severe penalties (up to 20 years' imprisonment with hard labour) were announced in June for those failing to present themselves when called up for service. Wrangles between U.G.T. (Socialists) and C.N.T. (Syndicalists) have been frequent, but public order has notably improved, and much less has been heard of assassinations and atrocities. Food is scarce, since refugees from territory occupied by the Nationalists, unable to stay in France, have had increasingly to cross into Republican Spain: the 4,000 Basque children brought to England in May 1937 are outstanding exceptions. Religious intolerance continues in Republican Spain: all Catholic churches, even if unharmed, are closed, and public worship is forbidden.

Catalonia, more prosperous materially than other Popular Front territory, has suffered grave political crises. In March 1937, strife between P.S.U.C. and P.O.U.M. and between U.G.T. and C.N.T. overthrew the three-months-old Generalitat Government, and a new coalition cabinet of six was formed by Socialists, Syndicalists, and Esquerra. The murders of a Socialist and an Anarchist leader in April were followed by an Anarcho-Syndicalist revolution in Barcelona in May. Several hundreds were killed; with the help of shock-troops from Valencia, the rebels were defeated; the Government again fell; and power was assumed by a committee of four, succeeded on June 29 by a cabinet (Socialists, 3; Syndicalists, 3; Esquerra, 3; Rabassaires, 1; Independent, 1), from which the Syndicalists almost at once resigned. In July, these events were followed by the arrest of the entire executive of the P.O.U.M. On Aug. 18, the Catalan parliament held a two-day session (the first for over a year), when the Socialists attempted unsuccessfully to impeach the speaker, Sr. Casanoves, who some months earlier had fled to France from the Extremists. After this, the situation improved, and Sr. Company's re-election to the presidency of the Generalitat lent it stability.

In Nationalist Spain, order is excellent, food plentiful, business good, confidence of victory high, and the peseta worth over

twice as much as in Republican Spain. Progress with the construction of the totalitarian State outlined in General Franco's Burgos speech of Oct. 1, 1936, has been steady, its chief features being the unification (April 19, 1937) of Falange Española and the Requetés into a single party; the adoption of the 26-point Falangist program; the creation of a "National Council," and the appointment of its first members; the institution of agrarian services, notably the National Wheat Service Board; and the announcement that social service is to be made compulsory for women. (See also AZANA, MANUEL; PHILATELY; POPULAR FRONT; SOCIALISM.)

**Trade and Communications.**—Agriculture is the main industry, olives, wine, and citrus and other fruits being extensively grown. The mineral wealth, especially in iron ore, copper, manganese, lead, mercury, and potash salts, is very great. In 1935, the imports were valued at £35,172,000, and the exports at £23,528,000. There are about 10,400 mi. of railway (mostly of 5 ft. 6 in. gauge), and over 60,000 mi. of roads. Air services connect Madrid with Barcelona, Lisbon, Paris, and London. The mercantile navy includes about 900 vessels of nearly 1,050,000 tons.

**Finance and Banking.**—The unit of currency is the peseta, nominally 25.22 to the pound sterling, divided into 100 centavos. Its exchange value is at present very uncertain, and at the end of 1937 varied within wide limits—60 to 100 pesetas to the pound. The estimated revenue and expenditure for 1936 were £176,800,000 and £182,800,000 respectively. The Bank of Spain is in contractual relations with the State.

**Defence Forces.**—No reliable details of the present military and naval strength of the contending forces in Spain are available. At the outbreak of war in 1936 the army was about 140,000 strong—raised by compulsory service—and there were some 200 military aircraft. The navy includes two battleships and seven cruisers.

**BIBLIOGRAPHY.**—A. Allison Peers, *Spanish Tragedy*, 6th ed., 1937; *Catalonia Infelix*, 1937; F. Borkeman, *The Spanish Cockpit*; H. E. Kaminski, *Ceux de Barcelona*; J. Medio, *Three Pictures of the Spanish Civil War*. (E. A. P.)

**Spain, Civil War in.** The success of the Popular Front in the Spanish elections of Feb. 1936 was followed by months in which the atmosphere was becoming charged with revolt. On July 13 the Fascist leader Calvo Sotelo was murdered by a band of shock police in revenge for the murder of a police officer the previous week. On July 17 the Civil War opened with the rising of the Foreign Legion in Morocco under the leadership of General Franco, who had flown there from the Canaries. That day and the next the officers of numerous garrisons led similar revolts in Spain itself. These failed in Madrid and Barcelona, but succeeded in Burgos, Saragossa, the Balearics, and other places. The great majority of the officers of the army had joined in the insurrection, but half the fleet and the bulk of the air force remained loyal to the Government, which sought to offset the defection of the army by arming the people. On the morning of the 19th the workers' militia assumed charge of Madrid, patrolling every street. The quiet was soon broken by Fascist snipers and motor guerrillas, and the process of hunting these down developed into a general outbreak of violence directed indiscriminately against those of Right Wing sympathies. A weeks-long reign of terror and confusion was inaugurated, in which many were murdered and much ecclesiastical property was destroyed. These widespread outrages were matched by deliberate ruthlessness on the other side, which, according to much neutral evidence, pursued a systematic policy, not only of giving no quarter to armed opponents, but of exterminating, in the districts where they seized control, those who were known or suspected of being politically on the Left. In this way they might

GENERAL FRANCO, insurgent leader, salutes Spanish Fascist parade on the annual "Day of the Race" celebration, commemorating the birthday of Columbus

**WOMEN FLEEING** before an aerial bombardment of the Basque capital, Bilbao, by Spanish rebel aeroplanes

safeguard their communications, while spreading fear among any who were inclined to offer resistance.

On July 24 General Mola set up a National Government at Burgos; his forces moved on Madrid, but were checked in the passes of the Guadarrama mountains. In the far north-west, the Nationalists had captured Oviedo, but were there besieged by the miners of the district. In the south the Nationalists captured Cadiz and then Seville, General Franco bringing Moorish and Foreign Legion reinforcements across from Africa, greatly helped by Italian bombers, which drove the Government warships away from the Straits of Gibraltar, thus clearing the passage. German warships appear to have given more veiled co-operation. But the part of the Spanish fleet which had joined in the revolt was also more effectively handled than the part which remained with the Government. The capture of Seville was followed by an advance northward to join hands with General Mola's forces. Badajoz was stormed on Aug. 14, a success that was followed by a particularly drastic cleaning up. In the north the Nationalists forced the evacuation of Irun on Sept. 4, after a long resistance, and then occupied San Sebastian. This blow precipitated the fall of Señor Giral's moderate Government, and it was succeeded by one under Señor Largo Caballero that was predominantly Socialist.

A convergent advance on Madrid then developed. In the south, Franco pressed on Toledo, where for two months a small band of his supporters had been holding out in the citadel, and Alcázar, besieged by a much larger if ill-armed force of militia. Toledo was reached on Sept. 27, and the retreat of the militia brought relief to the heroic defenders of the Alcázar. On Oct. 1 General Franco was proclaimed head of the Nationalist Government. On the 3rd a bombing campaign against Madrid by Italian and German aircraft began, while the encircling movement on the ground was extended, small Italian tanks helping to force the evacuation of various points of resistance. The fall of Madrid was regarded as certain, not only by the Nationalists, but by most of the outside world. A counter-offensive on the 30th brought momentary respite, but when its impetus slackened, the Nationalist troops followed up the ebb and established themselves in the outskirts of the city, although checked at the bridges across the Manzanares river. On Nov. 7 the Government left for Valencia, entrusting the defence to General Miaja. Next day the first detachment of the International brigade, a force of foreign volunteers recruited from many nationalities, appeared on the scene and greatly stiffened the resistance. A few days later the attackers' superiority in the air was effectively challenged by the Government's air force, reinforced by Russian fighter machines which had newly arrived. Air attacks became increasingly unprofitable, when results were weighed against risks. On land, now that the direct attack has superseded the earlier phase of manoeuvre, the

modern superiority of the defensive was manifested afresh. Franco's continued offensive efforts brought more loss than gain, and his progress everywhere became stagnant.

During the winter a state of deadlock prevailed, hardened by the weather. During these months the Government forces on the whole remained on the defensive, and succeeded, despite their inferior equipment and training, in frustrating the Nationalists' efforts to extend their gains. With each month of continued successful resistance, the Government's prospects were likely to improve—so long, at any rate, as General Franco did not receive a great increase of assistance from foreign sources. The deadlock was broken in February by the fall of Málaga, a Nationalist coup which was marked by good strategic judgment as well as by Italian backing on a new and important scale. The resistance was light, its moral stability being easily shaken by the effect of surprise on a state of unpreparedness.

The effort had a significant moral reaction. The Government was spurred to change their strategy, and to attempt a widespread series of offensives. These, as was to be expected, made no great material impression, except on the casualty totals. As was also to be expected, the exhaustion of the attackers offered a more promising opportunity for the Nationalist forces to renew their offensive. It remained to be seen whether General Franco's forces were capable of exploiting it sufficiently under the conditions of modern warfare. Their most threatening effort was the three-pronged stroke from Sigüenza south-westwards towards Guadalajara and Madrid, delivered on March 8, 1937. It followed an attempt to cut the road to Valencia, which, though incompletely successful, had drawn off the Government's best troops to the south. While the Guadalajara stroke preserved the assets of surprise and mobility, its promise was high, but these waned all the sooner because of the intervention of bad weather which gave the resistance time to harden and to be reinforced by General Miaja. Stuck in the mud, the Italians, who largely composed the attacking force, soon became ripe objects for a counterstroke, which came on March 13. Its dramatic success repeated the

experience of the World War, where the most striking victories, so long as the forces were fairly well matched, were produced by action of the counter-offensive form. It also showed, as the Abyssinian War had shown previously, that aircraft are specially formidable in such action, and that their advent has greatly enhanced its power.

In the spring of 1937 the Nationalists, baulked elsewhere, concentrated their efforts on an offensive campaign against the isolated Basque territory on the northern coast. Frequent clouds in the mountains at first hindered the use of the mass of Italian and German aircraft which had been concentrated for this purpose and, so long as this friendly cloak remained to compensate the Basques' lack of air defences, they proved able, though only a militia, to hold up the attack of superior ground forces. The experience showed that so long as troops in defence have the spirit to resist, their resistance is likely to prevail even under adverse conditions of training and equipment. A change in the situation came with a temporary improvement of flying conditions, and the progress which the Nationalists subsequently achieved coincided with their opportunities to employ their air superiority as a tactical lever, in loosening the defence of key positions which offered a well-defined target. Entrenchments in the mountains were far more visible from the air than those sited in valleys or plains. And the Basques were almost entirely lacking in either aircraft or anti-aircraft artillery with which to counter the threat overhead. Systematic air bombardment is hard to endure if there is a lack of direct counter-means, especially where the troops exposed to it know that their resistance on the ground does not suffice to cover their homes, and that their families are suffering a similar bombardment which they can't check.

A further asset which the Nationalists and their foreign allies used with marked effect in the Basque campaign was the concentration of artillery fire—as many as 200 guns on a  $1\frac{1}{2}$  mi. sector—to blast a hole at a particular point where it was desired to drive in a wedge, and thereby loosen the general front of the defenders. If such a volume of fire was an indication of the extent to which their artillery had been reinforced from foreign sources, the concentration was facilitated and enhanced through the way it was made a complement to the air bombardment, spread more widely. Its greatest effect was achieved when the Basques fell back on their so-called "Iron Ring" close to Bilbao, a line whose length without depth was its weakness. In contrast to the difficulty which the Nationalist artillery had met during the time of the Basques' manoeuvring withdrawal, they were now presented with a fixed and clear target, while the moral effect on the defenders, when a hole was punched in this line which had seemed so strong, was all the greater because the troops on the flanks of the breach felt themselves suddenly at a loose end, deprived of the firm pivot on which they had been made to lean too heavily. Lack of elasticity made the defensive dispositions brittle. It was a lesson of wider significance, confirming the experience of the last war, and showing that the best defence is the mobile form rather than the more obvious one of taking up, or falling back quickly to occupy, too obvious positions.

The capture of Bilbao in June was followed, after a short interval, by the advance on Santander, another objective where the defence was handicapped by lack of room for a manoeuvre in retreat within the narrow coastal strip, as well as by lack of means to nullify the attackers' main weapons. To these was now added

the use of tanks on a larger scale and with more effect than ever before in the Spanish War. The high ratio of machine-power to man-power was a significant feature of this offensive. According to report, the attackers used five small infantry divisions, totalling about 5,000 men apiece, but with them were employed about 200 tanks, nearly as many fighting and bombing aircraft, and artillery numerous enough to concentrate 18 batteries on the front of a single small division, with apparently a similar quantity supporting others. The August operations which culminated in the capture of Santander had been the one clear triumph of the offensive during the Spanish War hitherto, although recognition of the fact has to be qualified by recognition of the defenders' weakness. It suggests that raising the ratio of machine-power offers the only chance of successful attack, if it does not justify the assumption that this will prevail against a defender with similar equipment.

On land, the experience of the war has strongly supported the evidence of the World War that the defence is paramount at present. This has added significance, because relatively small forces in vast areas offered the attack more scope and a better chance, than it had on the closely packed Western Front. There have been a few successes gained merely by manoeuvre. But offensives by either side have in general had small effect in proportion to their cost of life. And, even when a local moral breakdown has momentarily cleared the attackers' path, experience has again confirmed that of the World War in showing that conditions set a term to their powers of exploiting it. In taking the offensive, each side was embarking on a venture whose tactical foundations were unsound, and whose slender chance of any great effect lay in the psychological sphere—in the possibility that the opponents might be ripe for a moral collapse. Otherwise a heavy sacrifice of life with little to show was the probable result. The original circumstances of the campaign, a military revolt against the Government, compelled General Franco to adopt an offensive strategy if he was to attain his aims; the extent to which his forces have pursued the offensive tactically would seem to have been more avoidable, and more dangerous to his cause. Hitherto, it has only brought a profit where he has been able to concentrate a great superiority of bombers, guns, and tanks against an isolated section of the opposition which has lacked the means to combat them as well as the depth of ground to avoid them.

On the other side, the contrasting circumstances of a Government without an army helped to produce a wiser tactical course, and this was long maintained. Its abandonment by the Government in February 1937, may be traced to later circumstances which were too strong for restraining calculation. Raw troops and mass levies are apt to lose morale when kept to the defensive, though it may be well suited to their conditions tactically; even trained forces may falter if thus restrained, unless they have been carefully taught that the highest art of soldiership lies in utilizing the advantages which fire defence and calculated withdrawal offer for entrapping the opponent. None the less, the side which nowadays pins its hopes to the attack courts the risk of undermining its own troops' morale in the effort. That risk has matured first on one side and then on the other.

General Franco, who started with the advantage in trained troops, could least afford to waste them: as he has done, not merely under pressure of circumstances. Since the autumn of 1936 he has been increasingly dependent on foreign resources in far greater measure than his opponents. And as the months have passed, it has become clear that his chances of military victory depend on the forces poured in by Italy and Germany—not so much in man-power, as in technical resources. **Spanish-American Literature.** Since the World War letters reveal greater individuality and more independence from European norms. They show a persistency in the "criollo" movement, more social concern and finer aesthetic tendencies. The novel has surged forth in a new school of its own, realistic, tragic, social, primitivistic, concerned with nature. The essay has depth and breadth rarely reached before. The most inclusive literary history appearing during 1937 was by Luis Alberto Sanchez; *Cuban Poetry in 1936* was edited by Juan Ramón Jiménez and José María Chacón.

The novel is well represented. Rómulo Gallegos wrote *Pobre Negro* that has passages the equal of anything he has written; L. M. Urbaneda Achelphol, *La casa de las cuatro pencas*, describes a provincial town; Julian Padrón in *Candelas de Verano* depicts Venezuelan country life; Antonio Reyes writes short stories, *Viudas de Color*; Mariano Azuela strikes a note of political criticism in *El Camarada Pantoja*; Mauricio Magdaleno utters the same criticism in *El Resplandor*; also Alfonso Tarracena in *Los abrasados*. Another interesting novel is *Alas Abiertas* by Alfonso Teja Fabre, who glorifies aeronautics. The hardships of colonization are vividly described by Manuel Méndez Ballester in *Isla Carrera*. Gerardo Gallegos draws short stories, beautifully written and conceived, *El Embrujo de Haití*. *Cienega* by Luis Felipe Rodríguez is a recasting of an excellent novel.

Other prose works: Eduardo Mallea, *Historia de una pasión Argentina*, an elegantly conceived psychic search of self and the *devenir* of a spiritualized people. Arturo Usler Pietri in *Red* reveals the critical touch of an artist. *Nuevas Páginas Libres* is from the master prose writer González Prada. *La clínica del Dr. Mefistópeles* by Alberto Gerchunoff shows elegance and irony. Ramón Díaz Sánchez's *Transición* is a study of Venezuela's present day affairs. *Nene* by the same author is of positive merit. A real contribution is Francisco Ichaco's *Defensa del hombre*. José Vasconcelos in *Breve historia de Méjico* praises Cortes and the Spaniards as benefactors of Mexico. Luis Fernando Alvarez's *Va y Ven* is a fine work. *Hombres y zorros* by Mariano La Torre relates country scenes in concise style. *Visperas de España* by Alfonso Reyes are the collected works on Spain by this excellent critic. José Gabriel's *España en la Cruz* has beautiful style and is full of observations. Gabriel's *Las semanas del jardín* is a gaucho motive. *Madrid* by Demetrio Aguilera Malta has vivid description.

Among the most illuminating biographies one should consider *Diego Portales* by Magdalena Petit, a dramatic life of the Chilean leader; *Obregón* by Hernán Robledo, thoughtful but journalistic; *Luis A. Martínez* by Augustus Arias, precise and animated; and his *Jorge Isaacs y su "Maria"* demonstrates the autochthonous in Isaacs' novel; Medardo Vitier's *Varona: Maestro de juventudes*, studies the Cuban philosopher; *Balmaceda, político romántico* by Luis Enrique Delano is interesting, but journalistic.

The artistic soul of Spanish Americans pours itself out readily in poetry. *Poemas del amor doliente* by José Santos Chocanos are some unedited marital love songs. Nicolás Guillén handles political poetry superbly in *Cantos para soldados y Sones para turistas*, as well as in *España: Poema en cuatro angustias y una esperanza*. In *España en el corazón*, Pablo Neruda shows imagination and intensity. Miguel Otero Silva cries out in behalf of suffering humanity. Manuel González Prada's *Grafitos* are good epigrams. Elías Nandino has feeling and sensual conflict in *Sonets*. In *Presencias*,

Leopoldo Ramos has trite regional colouring. *Ultimos poemas* is the most important collection of María Monvel. Xavier Icaza's *Marea Encendida* is a modernistic expression of love in its natural aspect, while *Triptos de amor y desamor* are musical stanzas of a passing love affair. Victor M. Rendón sings in classical form his *Himnos, votos y homenajes*. *Poesías* of Ruperto Gómez is a selection made by his sons. Emma Pérez, *Niña y el viento de mañás* is excellent poetry; so is *Tumulto* by José Portagallo; likewise, *Doble Acento* by Eugenio Florit. The dramatic poem *Pasión y Muerte de Silverio Leguizamón* of B. Canal Feijó is admirably written. *Wayno* by the promising Peruvian poet José Hernández is fine. *Teoría de la niebla* by R. Olivares Figueroa was selected for a prize by the Association of Venezuelan writers.

(J. M. HE.)

## Spanish and Portuguese Literature.

Nineteen-thirty-seven saw very many publications from both sides in the Spanish conflict. On the Government side, poetry was represented by the collection, *Romancero general de la Guerra civil*, by such writers as Altolaguirre, Varela, Infante, Garfias, Bergamín, Dieste, Prados, Hernández, and Plaja; and the series *Poetas de la España leal*, by such writers as Antonio Machado, J. M. Villa, R. Alberti, Altolaguirre, Cernudon, Prados, and Hernández.

Among the Government prose writers, Manuel Benavides wrote a novel on the present situation, *Crimen de Europa*. The president of the republic, Manuel Azaña, himself an essayist and poet, published various speeches. One of Spain's greatest writers, Juan Ramon Jiménez, did much in Cuba to help the Government. Another great writer, Ramiro de Maeztu, disappeared during the anarchist massacres in Madrid in 1936. A number of important Spanish writers remained neutral in Paris.

On the Insurgents' side, the great essayist E. Giménez Caballero, has written *La Nueva Catolicidad* and *La Falange Lecha Lombre Conquista el estado*. One of the most important Spanish poets, actually in Buenos Aires, E. Marquina, brought out *Por el amor de España*. The poet and playwright, J. M. Pemán, produced *Atencion! Atencion!; Almoneda*; and *Cartas a un Escéptico en Materia de forma de Gobierno*. Among much political and theoretical writings were G. P.-L. Suarez's *La España que muere y la España que nace*, General Mola's *Doctrinal de un Héroe y Hombre de Estado*, and Retortillo's important *Razones jurídicas de nuestra guerra*.

Among the poems dealing with the war from the Insurgents' side were A. Martin's *Castill y la Guerra* and *Romancero guerrero*, Muñoz San Roman's *Ideario patriótico* (this author also wrote a novel, *Las Fieras Rojas*), and Alconchal's *La novena cruzada*.

**Portugal.**—The literary event of 1937 for Portugal was the fourth centenary in April of the death of Gil Vicente, the great dramatist, which gave rise to a large number of books. Two volumes of poetry were outstanding, namely, *Epopeias, Diálogos com Deus* by António Marques Matias, and *O Homen Universal* by Teixeira de Pascoés, who tried in this book to discover the essential theme of life.

The novels of 1937 included: *Fui en que matei* by Sousa Costa, *A Casa fechada* by Vitorino Nemésio, *Tres raparigas em liberdade* by Amadeu de Freitas, and *S. Banaboião, Anacoreta e Mártir* by Aquilino Ribeiro.

(S. L. EN.)

**Spanish Civil War:** see SPAIN, CIVIL WAR IN.

**Spanish Guinea:** see SPANISH WEST AFRICA.

**Spanish Morocco,** zone in the north of Morocco, opposite Gibraltar, about 13,000 sq.mi. in area, with a population of 800,000; a Spanish protectorate, ruled by a

high commissioner representing the Spanish Government, the powers of the sultan of Morocco being delegated to a Khalifa. Capital, Tetuan (pop. c. 50,000). The people are Mohammedan Berbers or Moors, speaking Arabic or Berber dialects. Agriculture is carried on on primitive lines, and iron is mined; there are about 80mi. of railway, and over 500mi. of passable roads. Shipping trade is mainly through Ceuta, which, though on the African coast, is an integral part of Spanish mainland.

The Spanish civil war at present being waged began in July 1936 by a rising of troops in Spanish Morocco, which has since remained in the hands of the insurgents. In Jan. 1937 the French Government protested against the alleged infiltration into Spanish Morocco of German troops and the development of German military and commercial interests, including the building of barracks for a German armed force; but Hitler replied with a statement that Germany had no designs there. In May the Spanish Government declared that it looked upon the Moors in Franco's forces as foreign, not Spanish troops.

**Spanish West Africa.** Under this heading are included a number of Spanish settlements on the west coast of Africa and in the Gulf of Guinea.

Rio de Oro and Adrar extend along the N.W. coast from the Wadi Dra'a river to Cape Blanco. The area is 109,200 sq.mi., and the population are mainly nomadic Arabs, with less than 1,000 European inhabitants. The capital is Villa Cisneros. The territory is practically waterless. Ifni, further to the north, is a coastal strip of 965 sq.mi. at the S.W. end of the Atlas mountains. The estimated population is 60,000.

Rio Muni is a coastal settlement between the Cameroons and French Equatorial Africa, extending about 125 miles inland. The principal town is Bata, and the area is 9,470 square miles.

Fernando Pó, an island in the Gulf of Guinea, is the most valuable of these possessions. Its area is c. 781 sq.mi. and pop. c. 20,870. The capital is Santa Isabel. The products are ebony, mahogany, palm products, and very valuable cocoa.

**Special Areas.** The British Government created a precedent in 1934, when they appointed a commissioner for Special Areas with wide powers to provide work in the distressed areas of Glamorgan and Monmouthshire in South Wales, Durham and parts of Northumberland in North-east England, Cumberland in the North-west, and Clydeside and smaller areas of the East coast in Scotland. A revolutionary change was effected by the Special Areas (Amendment) Act, which received the Royal Assent on May 6, 1937, and granted power to the commissioners to give financial assistance to private enterprise. This was because of the comparative failure of the commissioners in the previous two and a half years to persuade industry to move to the distressed areas. The Government defence program has contributed in the past year to the reduction of 72,344 in unemployment in the Special Areas. The commissioner's latest report (November 1937) states that the cost of Government factories and agency factories in connection with defence, erected or in course of erection in the Special Areas of England and Wales, is approximately £15,500,000. In addition, between April 1, 1936, and the end of August 1937, orders to the value of £32,870,000 were placed in the Special Areas of England and Wales by the service departments. In spite of these orders and of the new powers conferred upon the commissioner to subsidize industry, transference schemes to more prosperous areas have led to 43,000 leaving their homes. In addition, the population fell in the year ending June 1937 by 37,929. On Sept. 13, 1937, there were still 210,608 unemployed workers in the Special Areas. The Government committed themselves, up to Sept. 30, 1937, to a

total expenditure of £12,900,000. The largest items of expenditure give a good idea of the types of schemes which have been favoured up to now, not only for the provision of employment, but the establishment of social amenities in districts rendered unsightly by the remains of dilapidated mines and factories. The heaviest expenditure (£3,080,000) has been on small-holdings schemes; then come trading estates and individual sites (£2,850,000), hospitals (£1,780,000), and sewerage disposal schemes (£1,715,000).

In addition, the trustees appointed to administer a fund of £2,000,000 given by Lord Nuffield in Dec. 1936, announced that they have promised financial assistance to 43 industrial undertakings in England and Wales to the extent of £1,346,000. Most of this money is being used in financing new industries. Another fund, the Special Areas Reconstruction Association, it was stated at the first general meeting in Sept. 1937, had agreed to loan £403,450 to 67 concerns which were providing a combined capital of £786,720 from other sources.

The immediate future policy of the commissioners for Special Areas will be to induce established firms in other parts of the country to set up branch establishments in the Special Areas, and to induce new firms to open their first factories there.

The power conferred on the commissioners in May 1937 authorized them to let factories at special rents and rates to any industrial undertaking: the commissioners may offer financial assistance to companies towards rent, rates, and income-tax; and loans may be made towards factory extensions.

It is obvious, from the terms of this act, that the Government has assumed a new responsibility for the location of industries. A separate report was issued for the Special Areas in Scotland. Since the end of 1934, when the commissioner began operations, unemployment in the Scottish Special Areas fell from 94,998 to 58,318 (June 1937). (See also NATIONAL INSURANCE; and for the United States see RELIEF; SOCIAL SECURITY.)

**Speedway Racing:** see AUTOMOBILE RACING.

**Spices.** The international trade in spices, which are principally used in the production of sausages, sauces, and pies, is chiefly directed towards the United States, the United Kingdom, and western Europe, the main exceptions being the trade in cloves, directed towards India and the Netherlands East Indies, and that in chilies, directed towards Ceylon. The greatest demand for the cinnamon of Ceylon is in Spain and Spanish America.

Of the various spices important in international trade, pepper is derived chiefly from the Netherlands East Indies, cloves come from Zanzibar and Madagascar, and the ginger plant is cultivated widely in tropical countries, including many parts of the British Colonial Empire. China is the leading exporter, the fresh ginger being sent to Hongkong, where it is preserved and exported.

The Netherlands East Indies export annually about 80,000cwt. of nutmegs, and Grenada about 25,000 hundredweight. India exports each year about 170,000cwt. of chilies, together with smaller quantities of cardamoms and other spices. Ceylon's export of cinnamon averages about 45,000cwt., and about 90,000cwt. of pimento are exported annually from Jamaica. Zanzibar and Grenada are the only countries where the trade depends very largely on the export of spices. Although India is an important source of supply of pepper, ginger, and other spices, the trade in these commodities makes up a very small part of the total exports.

Generally, more than one-half of United Kingdom imports of pepper comes from Empire countries, such as the Straits

Settlements, India, and Sarawak, although much of that shipped from the Straits Settlements is grown in the Netherlands East Indies. Imports in 1934 and 1935 were exceptionally large, owing to abnormal trading, but in 1936 and 1937 there was a considerable decrease. The British re-export trade in pepper is chiefly with the United States, Canada, and Germany. Practically all the British imports of cloves and fresh ginger are of Empire origin, and a very large part of the other spices also come from the Empire.

The United States for some years has maintained the chief position among all other countries in the direct consumptive demand of practically all kinds of spices, the only two exceptions being ginger and chilies. (A. E. Wl.)

**Spirits.** The world's greatest producer and consumer of spirits is the United States, and the development of the American market since Prohibition days has, either directly or indirectly, revolutionized the spirit trade of the world. When the United States repealed Prohibition, the country was without matured stocks of whisky. There were, however, plenty across the border in Canada, and the distilling industry of that country was saved from a serious crisis. Since repeal, stocks of matured spirits are being built up in the United States, and although higher taxes and enhanced prices tend to make the *pro rata* consumption lower, the production is now considerably higher than it was in 1917. Thus, in the fiscal year ending June 1937, 223,682,019 proof gallons of whisky, 2,523,629 of rum, 7,209,475 of gin, and 12,425,922 of brandy were produced, as compared with 57,651,834 proof gallons of whisky, 2,842,921 of rum, 5,756,666 of gin, and 8,251,097 of brandy in 1917; while in the fiscal year ending June 1937, tax was paid on 72,878,710 proof gallons of whisky, 532,325 of rum, 7,264,481 of gin, and 1,966,574 of brandy, as compared with 83,591,339 proof gallons of whisky, 659,815 of rum, 5,408,321 of gin and 3,551,084 of brandy in 1917. At the same time, however, taxes paid in 1937 on neutral spirits were for only 32,257,537 gallons as compared with 71,081,121 in 1917. It is estimated that up to 50% of this neutral spirit is used in the production of gin, and about one-third for blending with whisky, from which it is obvious that spirit blends are much less popular than formerly. In the U.S. blending is for cheapness, in contradistinction to the Scotch ideal, which is to harmonize in the one bottle the maximum number of high qualities.

In the United Kingdom, particularly in Scotland, the results of repeal have been far-reaching. After the World War, heavy duties and dwindling markets at home and abroad led to a steady contraction in the industry, both as regards the number of distilleries and of blending houses; but now that the American demand is several times what it was in pre-War days, and consumption throughout the world has increased again, the renovated distilleries have relit their fires. Imports of spirits from the United Kingdom to the United States rose from 1,496,995 proof gallons in the first 11 months of 1935 to 3,921,666 proof gallons for the same period in 1937. The blender, however, requires age and maturity in the single whiskies (he may use 40 or 50 of them) which he marries into his blend, and prices for single whiskies stand at unprecedented levels.

Next to whisky and gin, the favourite spirit with the Anglo-Saxon countries is rum. Large quantities are now being produced by the United States, particularly in the Virgin Islands; but Jamaica still produces the world's premier rum. Substantial quantities are also exported from other islands in the British West Indies. Brandy is not selling so freely as it once did, but the reputation of cognac remains as high today as ever.

(D. F. C.)

**Squash Racquets.** The 1937 championships were played at Cleveland, Ohio, where Germain G. Glidden, of the Harvard Club of New York, the defending champion, retained the title won the previous year, defeating Neil J. Sullivan, 2nd, of the Germantown Cricket Club of Philadelphia who held the title in 1934. The national squash racquets team championship of 1937 was won by the Boston team of Harry K. Cross, Edwin G. Hoehn, John H. Hull, A. M. Sonnabend and R. V. Wakeman. In the doubles national championship the Philadelphia team of Roy R. Coffin and Neil J. Sullivan, 2nd, won for the fifth consecutive year, defeating A. J. Ingraham and LeRoy Weir, of Cleveland.

The largest sectional championships are held by the Metropolitan Squash Racquets Association (of New York) where singles and team title events are played in classes A, B, and C, mixed and men's doubles, and veterans. Divisional championship contests were held in New Jersey, Westchester and New York State, and by the Intercollegiate Association. There were also invitation tourneys of the Rockaway Hunting Club, Nassau Country Club, Heights Casino, Round Hill Club, Union League Club, Squash Club and inter-city matches. There is a women's division of the Metropolitan Association, of which Mrs. Alfred W. Paine is president. The women's singles championship, held at the Junior League, was won by Mrs. Amy J. Lamme, Jr., of the Apawamis Club, over Miss Margaret Bostwick, of the Ardsley Club. (J. B. P.)

**Great Britain.**—The growth of the popularity of squash racquets was maintained at a steady rate during the past year. Thirty new clubs were formed, making a total of approximately a thousand squash racquets clubs in England open to the public. Cricket and lawn tennis clubs, too, are finding the introduction of squash a most satisfactory method of sustaining the interest of their members during the winter months.

F. Amr Bey remains as the unequalled exponent of the game. He has won the open championship, and the amateur championship, his contest with J. Dear in the former event being generally considered productive of a standard of play touching new heights of brilliance. J. Dear is the professional champion, while Miss M. Lumb is the holder of the ladies' championship. The county championship was won by Sussex, who beat Cheshire in the final, and the University match by Cambridge. (X.)

**Canada.**—The Canadian championships in squash racquets are also open to Americans. The singles championship, played in Hamilton, Ont., was won by Neil J. Sullivan, 2nd, over Cyrus H. Polley, of Buffalo. The doubles title tourney was played in Montreal, where Arthur H. Barker and Stanley Galowin, both of New York, defeated John Cornish and A. M. Sonnabend, both of Boston. This competition is for the A. F. Crichton challenge cup. (J. B. P.)

**Stainless Steels:** see CHROMITE; COLUMBIUM.

**Stalin, Joseph Vissarionovich** (1879— ), Russian statesman and dictator; born at Gora, Georgia, became an associate of Lenin in revolutionary work in Tsarist Russia, and was deported to Siberia in 1912. After the 1917 revolution, he became editor of *Pravda*, and in 1922 was appointed general secretary of the Communist party of Soviet Russia, succeeding Lenin on the latter's death in 1924 as the principal figure and virtual dictator of the Soviet Union, a position which he consolidated by the expulsion of Trotsky and his followers.

After the expulsion of Rykov and Bukharin from the party in 1937, Stalin, in a speech to the central committee of the party on March 3, denounced the Trotskyist movement as "an un-

principled organization of wreckers employed by foreign capitalist States" aiming at the destruction of Soviet achievements, and working hand in hand to that end with Germany and Japan. In June, the condition of Stalin's heart gave rise to some anxiety, and he was visited by a Vienna physician. In November it was proposed to recognize his position in relation to the Russian nation by conferring on him the new title of "possadnyik," or "protector" of the State. At the elections in December, for the new Supreme Council of the U.S.S.R., Stalin was nominated for a large number of constituencies, and returned for a division of Moscow, after declaring on the day before the polling that Soviet Russia's first general election, in which no candidate not approved by the Government was allowed to stand, was unexampled in history as the freest and most democratic election ever held in any country.

**Stamp Collecting:** see PHILATELY.

**Stanford University** (The Leland Stanford Junior University). The year 1937 was one of new construction at Stanford university. A memorial hall, containing a main theatre so constructed as to seat from 500 to 1,700, a smaller rehearsal theatre, theatre workshop, offices and classrooms, was completed. Its cost of \$600,000 came as a gift from faculty, alumni and students. As a memorial to their son, Mr. and Mrs. Howard Frost of Los Angeles presented the Laurence Frost Amphitheatre, an outdoor sunken oval completely surrounded by trees, and seating 8,000. Under construction is a School of Education building, a gift from Dean and Mrs. Ellwood P. Cubberley of Stanford university, at a cost of \$575,000. Additions were also made to Lagunita Court, a dormitory for women; and the former assembly hall was remodeled to house the rapidly growing Graduate School of Business with its Institute of Industrial Relations.

A "university division" was created for students of good ability who have attended Stanford or who transfer from other institutions, and who desire to obtain the Master's or other advanced or professional degrees without having to meet the requirements for the A.B. degree.

The faculty in 1937 numbered 480, the students 4,130, of whom approximately 1,100 were women and 1,035 graduates. With each year there is growing emphasis upon advanced work and the residence features of a university that has a campus of several thousand acres available for sports and open-air life.

(R. L. W.)

**State, Department of:** see GOVERNMENT DEPARTMENTS AND BUREAUS.

**State Legislation.** In retrospect, the year 1937 was characterized by four major trends in State legislation: (1) increased social legislation of all kinds; (2) a search for new sources of income and a continuance of emergency taxes; (3) reorganization and improvement of State administrative machinery, and (4) added impetus to the movement for interstate co-operation.

**Social Legislation.**—In the field of social welfare the legislation indicated a general shift from the special significance attached in 1935 and 1936 to securing enactment of social security laws to a concern over administration of those laws. This was reflected in the establishment in 18 States of welfare or public assistance departments and the reorganization of such departments in four other States. In general, the State agency is responsible for supervision of standards, while actual administration is lodged in the county or local unit.

The year's enactments brought every State within the list of those which have an unemployment compensation law. Virginia is the only State, which, at the close of the year, did not have a federally approved plan either for old age assistance, aid to dependent children, or aid to the blind. Many of such State aid plans go beyond the minimum standard set by the Federal Government, and in general, they broaden the scope of public assistance and indicate a consciousness of State responsibility for the needy hitherto exhibited only through State institutions.

In the field of State labour law several important developments occurred. The creation by five States of State labour relations boards modelled after the Federal law brings a new type of labour law to the States. The enactment by Pennsylvania of a general 44-hour a week maximum hour law applicable to men as well as to women is the most far reaching ever enacted. A general minimum wage law applicable to men as well as to women, adopted in Oklahoma, is the first of its kind. Workers in many occupations in widely scattered States will benefit by shorter hours, safer working conditions, better pay, increased disability compensation, and machinery for improved labour relations as a result of State labour legislation during the year. Progress in the child labour field was marked by the adoption of a basic 16-year minimum age in North and South Carolina, by the action of Missouri, New York and Vermont to prohibit intrastate sale of products of child labour, and by other increased restrictions on child labour adopted in a number of States.

**Housing.**—During the year 11 States enacted new housing authority laws, and nine States amended existing statutes. Thirty jurisdictions now have housing authority legislation, although there are two of them which apply only to a single city. Rhode Island alone does not grant the right of eminent domain to its authority. An important recent addition to housing authority statutes is a law which empowers cities and other local governmental units to co-operate with their housing authorities in essential ways.

**Planning and Zoning.**—Greatest progress in planning and zoning was made in the enactment of enabling legislation for local subdivisions. Two States provided for county and metropolitan planning boards, while enabling legislation for city boards was passed in six States. Several States made provisions for county and township zoning, although city zoning continues to have wider acceptance.

**Education.**—While school finance continued to be the major educational problem facing the States, proposals to improve the teacher's professional status received considerable attention and approval. Ten States enacted new or revised teacher tenure legislation, while new or revised teacher retirement laws were passed in 17 others. Other important teacher welfare legislation included the enactment of minimum salary laws in four and the revision of certification laws in eight States.

**Health.**—The most recent development in public health has been the approval given by the public and by officials to the problem of social disease. A reflection of this interest has been the enactment of a number of hygienic marriage laws. Under these, either one or both applicants for a marriage licence are required to obtain a medical certificate indicating freedom from venereal disease before the licence may be issued.

**Crime Control.**—A milestone in the work of crime control has been the rapid acceptance and enactment by the States of one or more phases of the four-point legislative program sponsored by the Interstate Commission on Crime of the Council of State Governments. This includes model bills to permit close pursuit by police across State lines, simplified extradition procedure, reciprocal supervision of out-of-State parolees and probationers, and simplified procedure for securing out-of-State wit-

nesses in criminal proceedings. The commission is working out administrative procedures for these laws, and is now attacking the control of firearms. Improved parole systems were provided for in several States. At the same time police or highway patrol systems were established or enlarged in all but three States which have hitherto been without them.

**Tax Legislation.**—Expanded social welfare programs, placing increased burdens on State budgets, have necessitated new sources of revenue. Of the two most fruitful sources of State income (sales and gasoline taxes), the gasoline tax continued the most popular and four jurisdictions raised their rates on this tax while several others continued emergency rates. Two new States put sales taxes into effect, and several others raised their rates or acquired accompanying use taxes. Colorado and Maryland entered the income tax field, placing levies on both personal and corporate incomes. At the same time a few upward adjustments were made in income tax rates. Six States adopted new or revised chain-store taxes, though this is still not an important source of income.

**State Administration.**—Kentucky and Tennessee completely reorganized their governmental machinery and placed more direct responsibility over department heads in the governor. Partial reorganizations were made in Connecticut, where the fiscal procedure was changed, and in Wisconsin where the governor was given power to shift boards and departments as it becomes necessary in order to improve management methods. Surveys of particular departments were made in several other States. Arkansas, Connecticut, Maine, Michigan, and Tennessee adopted civil service systems for their State employees. This is a greater number of civil service acts in one year than the total number which had been approved in the preceding 25 years.

**Interstate Co-operation.**—Significant from the standpoint of interstate and Federal-State relations, has been the rapid growth of the Council of State Governments through the establishment of commissions on interstate co-operation by the States. This movement, which has taken place only within the last three years, received such impetus during 1937 that 35 States now have such commissions and each of these States has by legislative action incorporated the Council of State Governments as a part of its governmental machinery, and established it as a governmental agency. A typical commission of this type is composed of five members of the State senate, five from the house of representatives, and five administrative officers appointed by the governor.

The Council seeks to develop better co-ordination and more active co-operation between groups of States in the various regions of the United States, and also between the 48 States as a whole. It also seeks to bring the State governments into better adjustment with the Federal Government and with county and city governments. It serves as the official research agency and clearing house for the Governors' Conference, the American Legislators' Association, the National Association of Attorney-Generals, and the National Association of Secretaries of State.

(H. W. To.)

**Steamships:** see SHIPBUILDING; SHIPPING, MERCHANT MARINE.

**Steel:** see IRON AND STEEL.

**Sterilization.** In considering prevention of reproduction in the human species, it must be determined whether or not it is planned to produce temporary or permanent sterility. Technique necessarily differs depending on this point. Again certain conditions may exist which necessitate castration to prevent all sex impulses, as is seen in certain psychoses.

The endeavour of surgical procedures to produce sterilization

is to prevent fertilization of the ovum by the sperm. This is produced by placing barriers in the Fallopian tubes. To date no methods have proved infallible. The method of crushing the tube and ligating with catgut suture material is probably the simplest technique, but is attended by many failures. A variation of this is to pick up a loop of the tube, crush it with forceps and tie both sides with catgut or silk. An improvement in this is to amputate the loop distal to the ligature. This seems to provide a more dependable technique which is particularly simple to carry out.

Another method has been to cover the far end of the tube with the membrane lining the abdominal cavity—peritoneum—and bury the uterine end in the musculature of the uterus. This has not proved so sure of results. The technique of excising the tube at the uterine cornu with a wedge-shaped section of muscle which surrounds it has been satisfactory in the experience of many surgeons. Some have removed the fundus of the uterus to accomplish this. The tubal procedures may permit of subsequent operation to restore the possibility of pregnancy if circumstances make this desirable. The uterine techniques do not.

In recent years the sterilization of the female has been carried out by cauterization of the tubal openings at the cornua of the uterus. This has been accomplished by the use of ingeniously constructed electrical cautery tips which are introduced through the cervix and uterine cavity. The advocates of this technique are enthusiastic in its support. Sterilization may be accomplished by the use of the Röntgen ray and radium. This technique requires the services of one thoroughly familiar with these agents and skilled in their use. The method is not certain in the production of sterility in all cases.

Experimental studies in the field of biologic sterilization with hormones have proved unsatisfactory. There seems to be evidence that this may be attended with danger. The work dealing with specific antibodies or spermatoxins has not as yet been developed to the point where authoritative conclusions may be formulated. It would seem that this may be possible.

In the male the resection of the duct from the testicle (vas deferens) has been the method of choice because of the technical simplicity of the procedure. There is an occasional failure due to the presence of supernumerary ducts. (J. R. BL.)

**Stevenson, James Alexander** (1881–1937), British sculptor; born at Chester, October 18. He studied at the Royal college of art, London, under Prof. Lanteri, won the college's travelling scholarship, and was also Landseer scholar in sculpture at the Royal academy schools. From 1911 to 1914 he was modelling master at the Regent street polytechnic. He exhibited at the Royal academy, the Paris salon, and the International society. His bust of Sir Frederick Kenyon is in the board room at the British museum, and that of a Roman emperor ("Imperator") is in the Tate gallery. Among his other works was the War Memorial to Devon regiments in Exeter Cathedral. To avoid confusion with another sculptor with a name identically the same except for its spelling, he used to sign his work by the *nom de plume* of "Myrander."

**Stieglitz, Julius Oscar** (1867–1937), American chemist who was among the first to apply the electron theory of valence in organic chemistry. His other researches included catalysis, molecular re-arrangement velocities, saponification of imidoesters and positive halogens. He was born in Hoboken, N.J., May 26, 1867, and received the Ph.D. degree from the University of Berlin in 1889. In 1892 he joined the faculty of the newly founded University of Chicago, becoming a

full professor of chemistry in 1905, chairman of the chemistry department in 1915 and director of the university laboratories (1912–24). During the World War, he served as special expert to the Public Health Service, chairman of the committee on synthetic drugs and vice-chairman of the division of chemistry of the National Research Council. He was president of the American Chemical Society in 1917 and of the Chicago Institute of Medicine in 1918. The American Chemical Society awarded him the Willard Gibbs Medal in 1923. His death occurred in Chicago, Jan. 10, 1937.

**Stock Exchanges.** Under the new system of governmental regulation of stock exchanges, occasioned by the Securities Exchange Act of 1934, numerous new rules have been adopted annually. During 1937, the many changes effected may be grouped under three main headings, namely (1) margin requirements, (2) commissions charged, and (3) listing requirements and supervision of members.

**Margin Requirements.**—During 1937 the New York Stock Exchange adopted regulations (1) to prohibit any member of the Exchange or a partner of any firm "from assuming for his own account at any moment a position in listed stocks through transactions on the Exchange that would make the equity in the account less than 55% of the long position, plus the usual margin on any short position," and (2) to prohibit any firm "from assuming for its own account at any moment a position in listed stocks . . . which it could not finance" in accordance with governmental regulations. By Government action also, following the drastic decline in securities during the year, margin requirements on long accounts were reduced to 45%, and on short accounts were placed at 50%.

**Commissions Charged.**—On Dec. 29, three changes were approved, to become effective Jan. 3, 1938, namely (1) a new schedule of commissions, increasing non-member commissions by an estimated 11% and member rates by 5%, (2) a rule permitting members who also hold membership on another exchange to charge whatever rates of commission may be prescribed by the other market, and (3) a service charge on inactive accounts.

**Listing Requirements and Supervision of Various Groups of Members.**—Changes in this respect were: (1) a detailed set of instructions to specialists with reference to dealings on the floor of the Exchange in stocks in which they are acting as specialists; (2) an amendment giving the committee on odd lots and specialists authority to supervise the activities upon the floor of members trading in stocks for their own account or otherwise, whereas previously the committee's supervision was limited to odd lots and trading by specialists; (3) revision of the requirements of the committee on stock list "to include additional protective provisions for mortgages, indentures and deeds of trust and for trustees of bond issues"; and (4) arrangement for a study of secondary distribution by a special committee "to co-ordinate and develop the policy and rules of the various standing committees in so far as they relate to the question of secondary distribution of listed securities and to trading in listed securities off the floor of the Exchange."

**Stocks and Bonds.**—The importance of the New York Stock Exchange as a major national market is shown by the huge volumes of listings of securities. For stocks, on Dec. 1, 1937, such listings aggregated 1,252 separate issues, totalling 1,408,078,066 shares with a market value of \$40,716,032,190. Listed bonds, on the same date, represented 1,375 issues, with a par value of \$47,175,452,551 and a market value of \$42,109,154,661. The number of issuing corporations or governmental units totalled 1,314 for stock issues and 677 for bonds. On Jan. 1, 1937, prior to the severe break in price levels during the later months of the year,

the aggregate market value of all listed stocks and bonds stood at \$104,931,721,722, of which total stocks represented \$59,878,127,946 and bonds \$45,053,593,776. Roughly speaking, the New York Stock Exchange serves as the market place for approximately a fourth of the nation's total wealth. Of the aforementioned totals, foreign stock listings on Dec. 1 aggregated only 38,401,142 shares with a market value of \$952,899,285, while private and public bonds of foreign nations stood at \$4,854,865,000 par value, with a market value of \$3,021,037,000.

Sales of stock on the New York Stock Exchange for 1937 totalled 409,468,885 shares, and for bonds \$2,792,531,000. For stocks the ratio of sales to listings amounted to 27.55% for the first eleven months of the year, the monthly average ratio varying from a minimum of 1.18% for June to a maximum of 4.30% for January. For bonds the ratio of sales to listings for the same eleven months amounted to 5.53%, the monthly average varying from .31% in August to .74% in January. Volume of sales was at a very low ebb during 1937, despite the severe decline in prices, the stock total being only 409,000,000 as compared with 496,000,000 shares for 1936, and bond sales only \$2,792,000,000 as compared with \$3,578,000,000 for 1936. To an increasing degree during recent years, the security market has become more and more a cash market. Net borrowings of New York Stock Exchange members on collateral, for example, amounted to only 1.69% of the market value of listed shares on Dec. 1, 1937, whereas at the same date for 1935, 1934, 1930, 1929, and 1928, the ratios were respectively 1.88%, 2.45%, 4.06%, 6.32% and 9.66%.

With respect to the New York Curb Exchange, sales during 1937 totalled 104,178,804 shares, as compared with 134,843,049 shares for 1936, and bond sales \$442,361,000 as compared with \$823,050,000 for 1936. In other words the sales on this exchange, the second largest organized security market in the Western Hemisphere, amounted to about one-fourth the stock sales on the New York Stock Exchange and to about one-sixth of the bond sales. The decrease in stock sales, as compared with 1936, was about the same as that experienced by the New York Exchange, although the decline in bond sales was considerably greater. At a recent date, 1934, 1,552 different corporations had security issues listed on the New York Curb Exchange. Of these corporations 1,117 had listed 783,582,441 shares, with a par value of \$5,661,151,748, as well as millions more shares without a par value. Mention should also be made of the San Francisco Curb Exchange, and the exchanges at Baltimore, Boston, Chicago, Cincinnati, Cleveland, Detroit, Los Angeles, Philadelphia, Pittsburgh, St. Louis, and San Francisco. Collectively, these exchanges are relatively small in comparison with the two major New York exchanges. The largest of these exchanges—the Chicago Exchange—has weekly share transactions equal to only about 3% of the New York Stock Exchange's weekly total, while for three other exchanges collectively—Boston, Baltimore and Cincinnati—aggregate weekly transactions amount to considerably less than 1% of the New York Stock Exchange's weekly total.

(S. S. H.)

**London.**—After rising uninterruptedly since the middle of 1932 industrial share prices fell between 20 and 25% during 1937, and the London stock exchange was forced to adapt itself to a reduced volume of trading, and a succession of shocks which had no equal since the depression. Despite severe technical strain in May and again later in the year, the stock exchange demonstrated its great underlying strength, and the two or three failures which occurred were all of insignificant dimensions. In April, the erroneous "gold scares" provided the market's first test; they were followed in a few weeks by the first version of the National Defence Contribution, which brought stock exchange business, including new capital issues, to a standstill.

TRADING IN STOCKS on the New York Stock Exchange, 1926-1937: yearly range of prices and number of shares sold, exclusive of odd-lot and stopped sales

Finally, the break in Wall street at the beginning of September again depressed prices in London. A substantial volume of forced selling was released by the closing of impaired margin accounts, and, but for co-operative efforts by important stock exchange firms to support intrinsically sound, but temporarily weakened, positions, the situation might have developed seriously. By the end of the year, equity share prices were discounting some recession in the high level of industrial activity.

Unlike the New York stock exchange, the London stock exchange provides no measure of turnover. All the evidence, however, suggests that the volume of business had fallen to such low levels at the end of the year that brokers were fortunate to cover their expenses. For the investor, last year's fall in industrial share values absorbed 23% of his capital. The fall in a mixed portfolio of gilt-edged, industrial debentures and preference shares, however, was no more than 5½%. Gilt-edged stocks, in fact, recovered from the low levels touched during the summer.

According to the report of the London stock exchange committee for the year to March 24, 1937, the nominal amount of securities quoted in the official list was £17,846,746,382, an increase of £322,261,009 over the previous year. During that year, 1,912 applications for permission to deal in new securities were granted, in respect of nominal capital totalling £697,174,206. The question of registration of stock exchange dealers was raised in the Board of Trade committee's report on "share-pushing," published in August. The committee decided against the restriction of share dealings to stock exchange members, on the ground that it was not prepared to recommend the grant of a charter to the stock exchange. The proposal to register share dealers, however, would not apply to the members of recognized stock exchanges, who would be exempt.

(R. E. B.)

**Stocks.** The outstanding development in the American stock market during 1937 was the generally drastic decline of prices. For all of the major classes of stocks the record for March, 1937, represented the highest monthly price level since the bottom depression figures of 1932. Optimism was prevalent everywhere and all stock market actions seemed to indicate clearly

(Source of data—Standard Trade and Securities Statistical Bulletin—Standard Statistics Company, Inc.)

the nation's emergence from the 1930-36 depression. However, near the close of March security markets commenced to waver, although for the following five months much resistance to the decline was in evidence despite the abundance of disconcerting news. With the beginning of August the decline assumed large and rapid proportions, despite surprisingly small dealings. During the next three months, September to November inclusive, the decline took on the proportions of a collapse. In fact, there are few instances on record where a larger percentage decline has been experienced within so short a time. However, following November the price level was substantially maintained to the end of the year.

The extent of the collapse is indicated by the averages published by the Standard Statistics Company. Thus a representative list of 50 industrial stocks experienced a decline from 163.9 for Aug. 1937, to 107.8 for November, or 34% within about three months. The November average price of 107.8 may be compared with 174.6 for March of 1937, the high point of the year, with 129.1 for Jan. 1936, and with 53.5, the yearly average for 1932, the bottom year of the depression. Twenty representative railroad stocks declined from 55.4 in July to 33.1 for November, or nearly 40½%, the November average (33.1) comparing with 64.8 for March, the high of the year, with 47.0 for Jan. 1936, and with a yearly average of 26.8 for 1932. Twenty representative utility stocks slumped from 81.7 in July to 63.3 for November, or 23%, the November average comparing with 100.9 for January, the high of the year, with 88.4 for Jan. of 1936, and with a yearly average of 85.7 for 1932. Similarly, a representative list of seven copper and brass stocks underwent a decline, during the period from August to November, from

232.8 to 115.4 or 50%, the latter monthly quotation comparing with 254.0 for March of 1937, and with 113.4 for January of 1936.

**Reasons for the Collapse.**—To many the unfortunate decline in stock market values seemed a mystery. The liquidation of the previous six years, along practically all business lines, had been so drastic and the abundance of funds so great and so cheap (call and time loans averaging constantly in New York at 1% and 1½%) that it was difficult to construe fundamentals as other than highly favourable to a long continued bull market. Yet adverse news piled up so plentifully during 1937 as to destroy the confidence of the investment and speculative community.

All through the year basic industries were plagued with labour upheavals, causing widespread disorganization in production as well as severe financial loss. Corporations felt more and more the burden of taxes levied on their undistributed profits and capital gains, thus greatly handicapping the expansion of industrial facilities. War and the prospects of war filled the newspapers continually throughout the year, with respect to nearly all the leading nations of Europe and Asia. At home there was an inability to balance the national budget, the spectre of a further increase in tax burdens, a governmental tendency to compete with private industry, and a general governmental attitude to wage war upon "big business." Governmental credit policies also tended to tighten credit to a degree that made it necessary for banks to secure funds by selling government securities. Moreover, many

TRADING IN STOCKS on the New York Stock Exchange in 1937: weekly range of prices and number of shares sold (exclusive of odd-lot and stopped sales)

## STORM TROOPS—STRATOSPHERE

political measures were either launched or threatened, which involved vast potential powers over business to such a degree as to constitute an unsettling influence upon business until the measures could be finally disposed of. Collectively, the bear news of the year was so large in volume and so sinister in its bearing upon the future that investment and speculative confidence cracked under the strain.

**Number, Volume, and Amount of Stocks.**—At the close of 1937, according to the New York Stock Exchange Bulletin, the total of stocks listed on the New York exchange, stood at 1,408,078,066 shares, valued at \$40,716,000,000. Of this total United States stocks aggregated 1,369,676,920 shares valued at \$39,763,132,905, and foreign stocks 38,401,142 shares valued at \$952,899,285. The total of shares were distributed over 2,293 separate American issues, and 334 foreign issues, representing a total of 1,145 issuing corporations. Total sales on the New York stock exchange during 1937 amounted to 409,468,885 shares (*New York Times*), as compared with 496,063,099 shares in 1936, and 1,124,991,490 shares in 1929, the largest total on record. The approximate value of the shares dealt in may be arrived at by multiplying the number of shares traded in during 1937 by the average yearly stock price index of all listed shares, as reported by the New York exchange for 1937, viz. \$50.62 per share. On the New York curb exchange, the second largest American security market by far, sales for 1937 amounted to 104,178,804 shares, as compared with 134,843,049 for 1936, and the high record of 474,000,000 shares for 1929. For other exchanges, data is not available. These markets, however, are relatively unimportant in comparison with the two major New York exchanges. Even for the Chicago exchange, the most important non-New York exchange, weekly transactions during 1937 totalled only about 250,000 shares, as compared with 8,200,000 shares for the New York stock exchange. (See also STOCK EXCHANGES.) (S. S. H.)

**Great Britain.**—On the London stock exchange, 1937 was a year of many vicissitudes. It came at the end of the recovery period, and by the beginning of the year there were many of the signs which commonly occur when recovery is nearing its climax. Already British Government securities were beginning to drop, for they opened in Jan. 1937, at some 3.5% below their average for the peak year, 1935. This showed that the long-term rate of interest was rising, and that the demand for capital was beginning to catch up with the supply. Meanwhile, there was a strong and partly speculative demand for securities and commodities, influenced to some extent by warnings and suggestions that world rearmament might make heavy inroads upon supplies of certain raw materials. On the other hand, there were indications that certain sections of the stock exchange had become top-heavy. Industrials and home rails were already beginning their decline.

British Government securities fell by about 5.5%, during the latter half of the year. Defence borrowing and expenditure, realizations by the banks in order to meet the growing demand for bank loans, and the prevailing uneasiness were the main causes of this decline.

They rallied slightly during the latter half of the year, partly because the general market weakness had begun to drive investors out of equities into British Government stocks. The net fall during the year was not quite 4%.

ANOTHER STRATOSPHERE FLIGHT by Professor Auguste Piccard was prevented when his balloon was destroyed by fire as it was being inflated on May 25

**Straits Settlements,** population (1931) 1,114,015, area 1,531 sq.mi., is one of the three main subdivisions of British Malaya, the others being the Federated and Unfederated Malay States (*q.v.*). It includes the two main ports of Malaya, Singapore and Penang. Its subdivisions are as follows: Singapore island; Penang island; Province Wellesley; Malacca; Pangkor; Christmas island; Labuan and the Cocos islands. It is administered by a governor with an advisory council (Governor, Sir Thomas Shenton Whitelegge Thomas). Chinese predominate in the mixed population of the colony, with Malays second and Indians third. Singapore (*q.v.*) and Penang are the outlets for the rich Malayan hinterland and carry on an important export trade in tin and rubber. Straits dollar (58.75 American cents). (W. H. CH.)

**Strathcarron, Ian Macpherson,** 1ST BARON (1880–1937), of Banchor, British lawyer and politician; born at Newtonmore, Inverness, Scotland. Ian Macpherson was educated at George Watson's college and Edinburgh university, and was called to the bar in Edinburgh. After failing to secure parliamentary election at the two 1910 general elections, he was returned for Ross and Cromarty in 1911 and sat for that constituency as a Liberal until 1931, and as a Liberal-National from 1901 to 1935. He was under-secretary of State for War, 1916–19; chief secretary for Ireland, 1918–20; and minister of pensions, 1920–22. He was made a P.C. in 1918, was created a baronet in 1933, and was raised to the peerage in 1936. He took silk in 1919, and was recorder of Southend from 1931 till his death. Lord Strathcarron, besides being a memorable parliamentarian and a skilful barrister, was a brilliant Gaelic scholar. His publications include *Life at a Scottish University*; *Satire in Celtic Literature*; *The Land Question*. He died in London, Aug. 14, 1937.

**Stratosphere.** To that part of the earth's atmosphere which is bounded beneath by the troposphere, above by the ionosphere, and thus lies at an altitude of 12 to 30km. (7.5 to 18.5mi.) Teisserenc de Bort has given the name of stratosphere. Whereas the troposphere is chiefly characterized by vertical movements of the air and the resultant temperature-

variations and precipitations, in the stratosphere only slight vertical air-movements occur; consequently, only slight variations of temperature and no clouds or precipitations.

The downward limit of the stratosphere is characterized by the fact that the temperature, which in the troposphere decreases more or less in direct proportion to the increase in altitude, suddenly becomes constant at a very sharply defined (not always the same) altitude. The altitude of this limit is subject to strongly marked fluctuations, depending on weather, time of year, and latitude. In the tropics it is at an altitude of 16km. (10 miles). In temperate latitudes at an average of 12km. (7.5 miles), though in exceptional cases it may fall to 5 or 6km. (3 or 4mi.), even in temperate latitudes. In summer it is usually at a greater altitude than in winter. In arctic regions the limit is at a lower altitude, about 8–10km. (5–6 miles). In the language of air-travel, these fluctuations are ignored, and everything above 12km. (7.5mi.) is spoken of as the stratosphere. The lowest part of the stratosphere has the same temperature (whatever that may be at the time) as the uppermost layer of the troposphere. The higher the limit, the lower the temperature. Accordingly, we find the lowest natural terrestrial temperatures in the tropics—about 75° below zero C. (135° below freezing-point F.). In temperate latitudes the temperature of the stratosphere comes to about 55° below zero C. (99° below freezing-point F.: lower in summer than in winter), and in arctic regions to about 45° below zero C. (81° below freezing-point F.). As one goes higher in the stratosphere, one finds a very gradual increase of temperature. Up to 30km. (18.6mi.), the increase reaches 5°–10° C. (9°–18° F.).

The movement of the air is horizontal and very even. The wind-velocity is usually highest at the lowest levels of the stratosphere and the highest levels of the troposphere; but even in the upper layers of the stratosphere, storms at 200km. an hour (125 m.p.h.) have been observed.

**Composition of the Stratosphere.**—If there were no vertical air-movements at all in the stratosphere, after a very long time the composition of the stratosphere would change in such a way that the lighter constituents of the atmosphere would increase in proportion to the heavier. We should find a higher proportion of helium and nitrogen, a smaller proportion of oxygen. But the slight vertical movements are sufficient to avert such a separation of constituents, or at any rate to keep it within such narrow limits that it is difficult to detect it by analysis and is certainly without any practical importance whatever in connection with air-travel. Strangely enough the carbon-dioxide content is much greater in the stratosphere than in the troposphere.

The aqueous content of the stratosphere is interesting, and is of the greatest importance in connection with air-travel. As the tension of saturated water-vapour at 50° below zero C. (90° below freezing-point F.) is very slight, it was supposed at one time that the stratosphere must be very dry. This view was supported by the fact that in the stratosphere clouds are practically never observed. But more recent investigations have shown that there are parts of the stratosphere which contain quite considerable quantities of supersaturated water-vapour. (Analysis of air-samples has established supersaturation-factors of more than 10.) This supersaturation is possible only when the air is completely free from dust (the air must therefore have been previously freed from dust by cloud-formation at a very high temperature). When dust makes its way into these super-saturated regions, clouds of frozen vapour are formed, and in certain cases, for example after volcanic eruptions or violent explosions, the precipitation reaches the earth as rain. Aeroplanes with the smoke from their engines can start long cirrus-clouds. On aeroplane-flights there is produced at the same time a deposit of ice, which so alters the shape of the wings and encumbers the aeroplane that flying becomes

impossible. This danger is greatest in the uppermost layer of the troposphere and the lowest layer of the stratosphere. As the altitude increases, the danger rapidly diminishes.

Air-pressure in the stratosphere diminishes continuously as the altitude increases, according to the well-known barometrical formula; in fact, owing to the low temperature, it halves itself every 4.4km. (2.7 miles). Measured barometrically it is 140mm. (5.5in.), at an altitude of 12km. (7.5mi.); at an altitude of 16km. (10mi.), 76mm. (3in.)= $\frac{1}{10}$  atm.; at 20km. (12.5mi.), 40mm. (1.6in.), and at 31km. (19.3mi.), 7.6mm. (.3in.)= $\frac{1}{160}$  atm. Consequently, although the stratosphere is far more extensive than the troposphere, its mass is only 17% of the atmosphere, against the troposphere's 82% and the ionosphere's 1%.

At great altitudes, an aeroplane, on account of the diminished density of the air, must fly faster than at sea-level to maintain lifting-power. But since, for the same reason, the air-resistance is less, an aeroplane can maintain a high speed with less power than at lower altitudes. Consequently, air-liners tend to fly higher and higher. There is reason to suppose that there will be progressive development on these lines, and that the air-liner of the future, on routine flights will normally, for long distances, aim at altitudes of about 16km. (10mi.), and that at these altitudes speeds of 700 to 800km. an hour (400 to 500 m.p.h.) will have to be regarded as normal rates of travel. Of course, at such altitudes pilots and passengers must be enclosed in air-tight pressure-resisting cabins, because even with oxygen-apparatus human beings cannot live at so low a pressure as  $\frac{1}{10}$  atm. (A. Pr.)

**Streamline Trains:** see RAILROADS.

**Strikes and Lock-outs.** The United States, Canada and Great Britain publish current statistics of strikes and lock-outs, their causes and results, together with detailed reports upon the more important strikes of each year. Most of the other nations report them less regularly; some not at all. The Canadian Department of Labour published a report on strikes throughout the world in the *Labour Gazette*, March 1937. The most recent statistics then available ended in 1935 for the following countries: Finland, Denmark, Sweden, the Netherlands, Poland, Czechoslovakia, Estonia, Hungary,

FARMERS JOINED NON-STRIKERS in storming a Hershey, Pennsylvania, milk chocolate plant and evicting sit-down strikers when the strike closed the farmers' market for milk

\*Strikes involving fewer than 6 workers or lasting less than 1 day are not included.

the Irish Free State, Uruguay, Union of South Africa, and British India; in 1934 for France, Latvia, Yugoslavia, Rumania, and Spain; in 1933 for Germany, Japan and Mexico; and in 1925 for Italy. The present study of labour disputes in 1937 will therefore be confined to the three countries first mentioned.

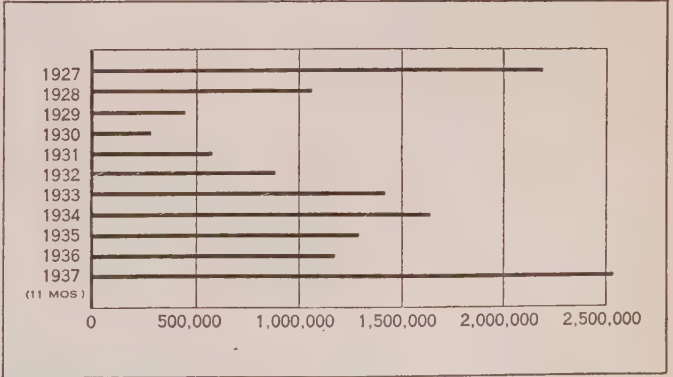

The United States was "the strike capital" of the world in 1937. Great Britain and Canada had more strikes than in 1936 but the number and severity were moderate compared with a number of earlier years. Labour disputes in France were a less prominent characteristic of the national life than in 1936. The political situation in Germany, Italy, Russia and Japan has made it "inadvisable" for wage earners to undertake strikes.

Table I shows for the United States the number of strikes, workers involved, and days lost, by months, 1936-37. The year 1937 exceeded in number of strikes every year since 1917. There were approximately a thousand more strikes than in 1919, the worst strike year between 1917 and 1937. The largest number of strikes between 1922 and 1933 was 1,553 in 1923. There were but 629 in 1928. Strikes began to increase in 1933 (see Table IV) and rose steadily to between 4,500 and 4,600 in 1937.

Though the number of strikes in 1937 exceeded the year 1919 the number of workers involved was far less. In the latter year 4,160,348 were out in 2,665 strikes for which such data is available; but in 1937 only 1,925,000 were out in approximately 4,500 strikes. The number of strikers was inflated in 1919 by the "great strikes" of the period—such as those in the coal mines, steel and textile mills, telephone industry of New England, the general strike at Seattle, the widespread struggles of clothing workers, longshoremen, the printing trades. In 1937, while there were definite points of concentration, such as the automobile and maritime industries, the year was characterized

by labour activity "on all fronts," including retail trade, hotels, restaurants and other service industries not affected by strikes in previous years, and a large part of the strikes involved relatively small numbers of people.

The industry most affected in 1937 was automobiles. Strike activity became significant in the automobile industry as early as 1934 and the tide of conflict reached its peak during the early spring of 1937 in the General Motors, Hudson and Chrysler strikes, all of which ended in union recognition and agreements. Forty-eight thousand automobile workers went out in the General Motors strike at the beginning of the year, tying up operations in 50 plants in 25 cities and stopping the employment of 126,000 workers. Throughout the year there were numerous "illegal" strikes by workers under these agreements, many of them short sit-down strikes, and in November strikes again broke

STRIKES AND LOCK-OUTS in the United States: monthly average of man-days idle

out at General Motors and the Hudson Motor Company, chiefly over impatience and suspicion concerning the renewal of the agreement. During the latter part of the year, the United Automobile Workers staged several strikes at St. Louis and Kansas City against the Ford Motor Company, but up to the end of 1937 did not attempt a major strike against the Ford Company.

The Pacific coast maritime strike, which lasted 98 days and ended on Feb. 4, 1937, involved directly 37,000 workers, and many thousands indirectly. In contrast to the maritime strike of 1934 there was practically no violence. Each side appealed to public opinion by press and radio, and leaders of the opposing parties engaged in public debates before large audiences. The strike arose in difficulties connected with the revision and renewal of agreements which expired Sept. 30, 1936.

Other large strikes in 1937 occurred in the leading "independent" steel mills (Bethlehem, Inland, Republic, Youngstown Sheet and Tube), which started in May and gradually died out; a strike in the silk and rayon industry during the summer which resulted in agreements similar to those of the men's and women's clothing industries; several strikes in the rubber industry at Akron, Ohio; and the bitter strike in the properties of the Remington-Rand Company in New York, Ohio and Connecticut.

Sit-down strikes, while numerous, were not as important a part of the American strike picture in 1937 as they were in 1936. States began to enact legislation designed to prevent sit-down strikes. In Tennessee, for instance, employees are required to withdraw from the premises of the employer within 12 hours "of the date of such cessation of employment" (Tennessee Public Acts 1937, Chapter 160). Vermont passed a similar law. The U.S. Supreme Court refused to review a sit-down strike decision appealed by strikers of the Apex Hosiery Company, in the city of Philadelphia.

That is the nearest that the legality of sit-down strikes got to decision by the Supreme Court.

Many lower courts have held that sit-down strikes exceed the legal rights of strikers.

There were one day general strikes at Lansing, Mich., June 7, to protest against the arrest of pickets for alleged violation of an injunction, and at Niles and Warren, Ohio, on June 23, in protest against the passage of non-strikers into and out of the plants under protection of the National Guard.

Comparatively few strikes resulted from the bitter conflict between the American Federation of Labor and the Committee on Industrial Organization. Here and there, as among the warehouse

Lower: ONE OF TEN FATALITIES of the battle in which more than 100 were injured, including twenty-three policemen

workers of San Francisco and the lumber and saw-mill strike in Oregon, the split in the ranks of labour resulted in strikes, but the activity of the National Labor Relations Board and State boards, such as the Wisconsin Labor Relations Board, in the adjustment of conflicts between the two labour groups prevented these conflicts (in most instances) from ending in strikes.

The monthly reports on strikes issued by the United States Bureau of Labor Statistics indicate that half or more of the strikes of 1937 involved some question of union recognition, with wages the other major issue. It was a year of offensive strikes—strikes to compel union recognition, for wage increases, for shorter hours, and other positive gains. But a small percentage of the strikes were definitely defensive, though many short strikes were occasioned by what workers believed to be employer infractions of agreements. On the whole, labour

fared well in efforts to improve its status. In June, for instance, 45% of the settlements resulted in substantial gains; and 32% more in compromises.

Labour disputes in Great Britain in 1936 and 1937 are shown for the first 11 months of each year in Table V. It will be observed that the number of strikes and number of workers involved was almost 50% greater in 1937, but was small compared with the situation in the United States, even when the difference in the sizes of the populations is considered. The most important areas of increased conflict were coal mining, engineering and shipbuilding, textiles, food manufactures, and the transportation industries, while the distributive trades and clothing manufacturers showed sharp decreases both in the number of strikers and man-days lost.

The 1,076 strikes, January-November 1937, may be compared with 1,607 in 1920, 323 in 1926, 471 in 1934 and 818 in 1936. It is

The Ministry of Labour Gazette, December, 1937, p. 199.

evident that the number of strikes in 1937, when the 12 month figure is available, will be the highest since 1920.

Tables II and III show the causes of labour disputes and their results during the first 11 months of 1937. Two contrasts with the United States situation stand out—in Table II the absence of “union recognition” unless included in “questions involving trade union principles,” and in Table III the large percentage of the strikes which ended definitely in favour of the employers.

Canada reported 342 strikes during the first 11 months of 1937, involving 69,827 workers and the loss of 804,469 man-days. In 1936 there were but 156 strikes, with 34,812 strikers and 276,997 days lost; a rather typical strike record for Canada. But in 1921, '22, '24 and '25 over 1,000,000 days were lost each year on account of strikes and 1919 over 3,400,000 days in 336 strikes. The year 1937 ranks among the worst years so far as number of strikes is concerned, but, like the United States and Great Britain, it was a year in which there was a large number of small strikes, resulting in a moderate loss of working time. Suez Canal.

Between Jan. 1 and Dec. 20, 1937, 6,431 ships of a total tonnage of 27,822,000 tons passed through the canal, as compared with 5,685 ships of a total ton-

nage of 21,531,000 in 1936. The total dues paid amounted to £10,492,300, or £452,800 less than during the corresponding period of the previous year. A factor in this decrease in total dues was the reduction made, as from April 1, 1937, in dues for laden vessels to 6s. per ton, for vessels in ballast to 3s. per ton, and for passengers to 6s. per head, children under 12 being taken at half price.

The arrangement made with the Compagnie Universelle du Canal Maritime de Suez in May 1936 by the then president of the Egyptian Council of Ministers, Aly Maher Pasha, was replaced on June 14, 1937, by a new agreement signed by Makram Ebeid Pasha, Minister of Finance. This provided for a royalty to be paid by the company to the Egyptian Government of £E.300,000 annually, payable in quarterly instalments, for the proportion of Egyptian-born subjects to be engaged by the company in the administration to be 33%

of the total strength of the purely administrative staff, and for the company to undertake to construct, at its own expense, up to a maximum cost of £E.300,000, the military road in the Isthmus of Suez prescribed under the Anglo-Egyptian treaty. In addition it was agreed that two seats on the board of directors, instead of the one so far provided, should be reserved for Egyptians, and that, if at any time the total number of directors was increased, one of the new seats should be held by an Egyptian. (See also CANALS AND INLAND WATERWAYS.) (A. Mn.)

Sugar.

World production and distribution of sugar in 1937 pivoted on the international agreement in London in May, when plans were formulated for international, co-operative regulation of production and distribution in 21 countries. The agreement became provisionally effective September 1, subject to acceptance by various countries, and was ratified by the U.S. Senate December 20. It allots quotas and is designed to run five years.

Total world production of sugar, raw values, for the 1937-38 crop year is estimated by the International Association for Sugar Statistics and F. O. Licht as 29,691,544 metric tons (28,895,829). All figures in parentheses herein are for the immediately preceding crop year, that of 1936-37. In this estimate cane sugar totalled 18,898,500 metric tons (18,694,048).

**Beet Sugar.**—For raw beet sugar the International Institute of Agriculture gave the 1937-38 world estimate as 12,136,889 short tons (11,136,889), of which 10,479,889 short tons were produced in Europe in 1937 (9,552,170 in 1936), and in the United States and Canada 1,529,000 short tons (1,482,268). The U.S. Department of Agriculture estimated the 1937 sugar-beet crop at 8,798,000 tons of beets (9,028,000), from which a raw sugar tonnage of 1,286,000 short tons was estimated. The 1936 production was 1,304,000 tons. International Institute of Agri-

culture estimates for beet sugar, raw, in different countries in 1937 and 1936 follow:

Russia, 2,800,000 short tons (2,203,000). Germany, 2,330,400 short tons (1,984,424). United States 1,468,000 short tons (1,396,000). France, 1,004,700 short tons (959,600). Czechoslovakia, 817,989 short tons (800,930). Poland, 610,000 short tons (505,382). United Kingdom, 526,000 short tons (649,534). Italy, 371,100 short tons (359,000). Sweden, 347,000 short tons (329,803). Belgium, 266,000 short tons (268,345). Denmark, 259,000 short tons (249,300). The Netherlands, 234,060 short tons (258,769). Spain, 226,000 short tons (249,000). Austria, 168,000 short tons (161,480). Hungary, 132,340 short tons (158,600). Irish Free State, 103,300 short tons (107,414). Rumania, 96,000 short tons (86,855). Canada, 61,000 short tons (86,268). Turkey, 70,000 short tons (72,626). Japan, 58,000 short tons (53,448). Latvia, 53,000 short tons (46,776). Yugoslavia, 50,500 short tons (110,073). Lithuania, 32,500 short tons (29,820). Bulgaria, 29,000 short tons (12,000). Switzerland, 13,000 short tons (10,000). Finland, 10,000 short tons (12,122).

**Cane Sugar.**—Estimates for cane-sugar production in different countries were given by the International Association for Sugar Statistics and F. O. Licht as follows:

British India, 2,100,000 metric tons gur (2,227,000) and 1,275,000 metric tons white sugar (1,362,000). Cuba, 3,146,000 metric tons (3,144,589). Java, 1,420,000 metric tons (1,414,000). Japan (Formosa), 1,278,000 metric tons (1,157,348). Philippine Islands, 1,010,000 metric tons (1,017,314). Brazil, 985,000 metric tons (915,914). Hawaii, 965,000 metric tons (929,640). Porto Rico, 875,000 metric tons (903,830). Australia, 752,000 metric tons (769,112). South Africa, 472,000 metric tons (440,412). British West Indies, 471,000 metric tons (455,372). Dominican Republic, 460,000 metric tons (451,936). Argentina, 410,000 metric tons (480,046). China and Indo-China, 457,000 metric tons (535,000). Peru, 365,000 metric tons (409,000). Mauritius, 315,000 metric tons (300,340). Mexico, 290,000 metric tons (332,000). British Guiana, 180,000 metric tons (180,000). Fiji Islands, 155,000 metric tons (153,924). Egypt, 150,000 metric tons (137,000). French West Indies, 92,000 metric tons (95,000). Central America, 89,000 metric tons. Haiti, 38,000 metric tons (36,583). Virgin Islands, 8,000 metric tons (3,411).

The Sugar Section of the U.S. Agricultural Adjustment Administration estimated sugar requirements of the United States for the calendar year of 1938 as 6,861,761 short tons, raw value and allotted the quotas from producing areas as follows: Continental United States, beet sugar, 1,591,390 short tons; cane sugar, 431,415 short tons. Cuba, 1,962,771 short tons. Philippine Islands, 1,057,416 short tons. Hawaii, 963,149 short tons. Porto Rico, 819,344 short tons. Virgin Islands, 9,155 short tons. The foregoing areas are either U.S. territory or enjoy preferential tariff rates. The remainder of 27,121 short tons of the United States 1938 quota was allotted as follows: Peru, 12,077,314lbs. Nicaragua, 11,106,817lbs. San Salvador, 8,919,943lbs. Mexico, 6,554,623lbs. Dominican Republic, 7,246,410lbs. Honduras, 3,730,055lbs. Haiti, 1,001,487lbs. Canada, 613,102lbs. United Kingdom, 381,058lbs. Guatemala, 363,927lbs. Belgium, 319,815lbs. China and Hongkong, 313,684lbs. Venezuela, 315,135lbs. Czechoslovakia 286,121lbs. The Netherlands, 236,747lbs. Dutch East Indies, 229,704lbs., and other countries in varying smaller quantities. (See also CUBA: *Agriculture and Mineral Production*.) (S. O. R.)

**Suicide Statistics.** About 15,000 persons commit suicide in the U.S. each year. The rate of such deaths places the U.S. about midway in the suicide scale between the record low of the Irish Free State, which averaged about

Suicides per 1,000,000 Inhabitants, 1920-36

Years	United States	England	Scotland	Northern Ireland	Irish Free State	France	Germany	Austria
1920 . .	102	91	49	27	20	175	213	218

1936 . .	..	124	100	39	..	..	..	..

30 suicides annually to 1,000,000 inhabitants during the last 15 years, and Austria, with the highest rate which reached 441 per 1,000,000 inhabitants in 1932. Suicides increased in most countries preceding the World War, and decreased during the war. They rose again in subsequent periods of business stringency.

(R. R. K.)

**Sulphanilamide:** see DRUGS AND DRUG TRAFFIC; EPIDEMICS; MEDICINE: *Sulphanilamide*; PNEUMONIA; SURGERY.

**Sulphanilamide, Elixir of:** see AMERICAN MEDICAL ASSOCIATION; DRUGS AND DRUG TRAFFIC; MEDICINE: *Sulphanilamide*.

**Sulphur.** The United States is the outstanding sulphur producer of the world, with about three-quarters of the entire output; Italy is a poor second, with one-sixth, and Japan third with one-fifteenth; all other producers are so small as to be negligible so far as the world industry is concerned, although the production may serve to satisfy local needs. World production reached almost 3,000,000 metric tons in 1929, dropped to 1,625,000 tons in 1932, and recovered to about 2,500,000 tons in 1936. Italian production has remained with little change during recent years, while Japan has been consistently increasing.

The United States output dropped by more than half during the depression years, and has now recovered to better than 2,000,000 tons, which is still 23% below the 1929 high.

Technologically, some progress has been made in the recovery of elemental sulphur in the roasting of sulphur-bearing ores. While some of the sulphur dioxide thus made has for many years been used for the production of sulphuric acid, a large proportion has been wasted, creating at the same time an economic waste of considerable magnitude, and a nuisance that involves expense for its abatement. Active work along this line is being done in England, Norway, Sweden, and Finland.

(G. A. Ro.)

**Sumatra,** which lies north-west of Java and which, along its north-western coast, is closely adjacent to the Malay peninsula, is after Java the most important and after Borneo the largest of the Sunda islands. Its area is 163,145 sq.mi.; population (1930) 8,238,570. It is almost bisected by the Equator, lying between 5° 4' North and 5° 59' South. It contains a long mountain range called the Bukit Barisan ("array of mountains"), of which Mount Indrapura has an elevation of 13,700ft. and Mount Ophir of 10,483 feet. The range faces the Indian ocean and descends toward the East into a broad plain, which is covered by immense forests and moors. There is a long line of volcanic peaks, of which the most famous is Krakatoa, in Sunda strait. Sumatra is

less advanced and less economically developed than Java, but enjoys the same rights of representation in the Volksraad. The island possesses both agricultural and mineral resources. Native agricultural production is mainly devoted to rice cultivation, although Sumatra is not self-sufficient in rice and depends to some extent on imports from abroad. Rubber and coffee are the main products of the European plantations. Government coal mines in Sumatra yielded an output of about 830,000 tons in 1928. The output of crude oil in the same year was about 880,000 tons. Limited amounts of gold and silver are also mined. (W. H. CH.)

**Sunday Schools.** The world's Sunday school convention at Oslo, 1936, reported 369,510 Sunday schools in 129 countries, with 3,145,895 teachers and 34,139,624 scholars. This represents an increase in four years of 2.75%, considerably less than in previous quadrennia. Africa and South America showed large increases; Europe a small decrease. In September, 1937, it was reported that the Methodist Episcopal Church had suffered a decrease since 1925 of 6,764 Sunday schools and 902,529 teachers and scholars. Decline in adult classes, growth of other forms of organization for the religious education of youth, competition of varied interests and allurements in a materialistic age, and falling birth rate, are reasons cited. In Japan a decrease is reported due to the growth of militarism and the requirement of worship at national shrines. Dissent from the latter policy brought punishment upon some Sunday-school leaders and Christian educators in Korea. Sunday schools are forbidden by law in Russia; and in Turkey they may be conducted as "children's worship services" only.

In Great Britain advances were made in the grading of Sunday schools and in closer co-operation between Sunday schools and elementary day schools. In India native leaders were placed in charge of teacher-training and of a new religious education department of the National Christian Council. The first general Sunday school convention for the Bantu people was held in South Africa. Sunday school work made progress, with the approval and co-operation of ecclesiastical authorities, in the Armenian Church, the Coptic Church, and the Greek Orthodox Church. A nation-wide movement in China for the training of voluntary lay church workers, initiated by the National Committee for Christian Religious Education, got well under way before the invasion of China by Japan.

In spite of its world-wide spread and its adoption by other than Christian faiths, notably the Buddhists of Japan, the Sunday-school movement is still strongest among English-speaking peoples. (L. A. WE.)

## **Supreme Court of the United States.**

In a special message to Congress on February 5, President Roosevelt started a political controversy, which for unrelenting bitterness dwarfed all others of the year in the United States. An earlier hint of his intention to try legislative means for coping with the troublesome problem of judicial veto had stimulated members of the two houses to present various partial remedies. But in the February message Mr. Roosevelt called for a root and branch reform and a general revitalizing of the courts. He submitted the draft of a bill which provided:

(1) For the voluntary retirement of Supreme Court justices at the age of 70 on full pay and the appointment of an additional justice for every eligible justice who failed to take advantage of his privilege to retire, saving that the total membership of the court should never exceed 15.

(2) For the appointment on similar grounds of additional circuit and district judges.

(3) For direct appeals from district courts to the Supreme Court on all constitutional issues.

(4) For the restraint of lower courts from issuing any injunction against the enforcement of a federal law without sufficient notice to the Department of Justice so that a competent defence could be prepared.

These points were not new or inherently objectionable. The procedural reforms had often been urged by members of the legal profession. And the desirability of creating inducements for aged judges to leave the bench was generally recognized. Even the conservative Justice McReynolds, had, as attorney general in 1913, recommended the enactment of a law substantially embodying the second point above enumerated. And Mr. Hughes had in 1928 spoken deprecatingly of superannuated judges who "seem to be tenacious of the appearance of adequacy"—a sentence aptly quoted by Mr. Roosevelt in his message.

The objection was not to the proposed changes in themselves, but to their obviously intended use as a means of altering the political composition of the Supreme Court. The sudden addition of six new justices within a year after the Court had rendered eleven decisions against the Administration's basic program, appeared to the eyes of conservatives as an assault upon the independence of the judiciary. And many professed liberals expressed alarm lest the precedent be used against them in the future.

The attitude of Republicans as a party was expressed in the instant denunciation of the bill by Herbert Hoover, Alfred Landon, and John Hamilton. The Democrats were divided. The press stood predominantly with the opposition. A test poll showed that only a minority of the Senate heartily favoured the measure but that party discipline would probably suffice to secure its passage. Public hearings before the Senate Judiciary Committee began on March 10 and lasted through April 23. Moderate leaders in Congress pressed for an early passage of the pending Sumners-McCarran bill, which provided merely for voluntary retirement of Supreme Court justices over 70 years of age. It was their hope that this would tempt one or more conservative members of the tribunal to step down and thereby remove the urgency for a more drastic act. This measure did quickly pass both houses and was signed by the President on March 1. At the same time a visible shift in the Court's position toward progressive legislation—notably in its decisions upholding the Washington minimum wage law (March 29) and the Wagner Labor Relations Act (April 13)—strengthened the opposition. So also did the letter addressed by Chief Justice Hughes to Senator Wheeler denying that the Court was behind its calendar and stating that additional members would rather lessen than increase its efficiency.

It was clear by the end of April that the Senate committee would report against the bill, although its actual vote to do so was not taken until May 18, the same day on which Associate Justice Van Devanter announced his intention to retire. Whether the timing of these two events was pure coincidence or not, its effect was further to weaken support of the bill. On July 2 a substitute measure known as the Hatch amendment was introduced on the Senate floor with the sanction of majority leader Robinson. This at first seemed likely to command a majority vote. But as the debate dragged on, support for it dwindled.

Robinson's sudden death on July 14 removed the last vestige of hope for its adoption. Further concessions from the Administration proved unavailing. Finally on July 22, through the good offices of Vice-President Garner, an agreement was reached which resulted a few weeks later in the enactment of a law

THE SUPREME COURT of the United States, as constituted in 1937 after Justice Black (fourth from left, standing) succeeded Justice Van Devanter, resigned. Sitting, from left to right: Associate Justices George Sutherland; James C. McReynolds; Chief Justice Charles E. Hughes; Associate Justices Louis D. Brandeis; Pierce Butler; Standing, from left to right: Associate Justices Benjamin N. Cardozo; Harlan F. Stone; Owen J. Roberts; Hugo L. Black

providing for certain reforms in the lower courts without reference to the Supreme Court.

This ended for 1937 the main phase of the judiciary struggle. There followed immediately a new controversy over the question, who should fill the place vacated by Mr. Van Devanter. A strong movement in the Senate favouring Mr. Robinson had been defeated by his death; and no new preference by that body had crystallized before August 13 when the President submitted the name of the aggressive New Deal Senator, Hugo L. Black. In the debate which ensued opposing senators emphasized particularly what they deemed to be constitutional objections. But Senator Copeland dwelt more insistently upon the charge that Mr. Black owed his seat in the Senate to the Ku Klux Klan. In spite of this the nomination was approved August 17 by a vote of 63 to 16.

Public discussion of the subject was re-opened in September through the syndicated publication of a series of news articles which purported to prove that the new associate justice had been and was still a Klansman. Mr. Black refused all comment until his return from a vacation abroad. Then, speaking over a nationwide radio hookup, he declared that he had joined the Klan 15 years ago, had later resigned, and had never rejoined. The statement virtually closed the issue though some flickering interest in it was revived during the early weeks of October when a futile effort was made to have the appointment set aside by the Court itself. (See also AMERICAN BAR ASSOCIATION; LABOUR UNIONS; *Supreme Court Decisions*; CONGRESS, UNITED STATES.)

(G. P. BA.)

**Surgery.** The outstanding contribution to orthopaedic surgery in late years has been the revival, on a sound basis, of internal fixation for recent fractures of the neck of the femur or thigh bone by means of a triple flanged nail, or by pins, or by lag-screws. These methods make wearing of a cast unnecessary and permit early movement of the leg. Not only is union of the broken bone obtained in a high percentage of cases but the stiff hip and stiff knee are largely prevented.

In plastic surgery, better understanding of the instances requiring use of the pedicle skin graft, of the free dissected graft and of the shaved graft has improved the cosmetic results of plastic operations about the face. Advanced methods of transplanting flaps of mucous membrane from the nose to replace the absent mucous membrane in cases of cleft palate have improved functional and cosmetic results. The inlying split skin graft taken from the thigh also has been more extensively applied than before in treatment of certain congenital abnormalities of the genito-urinary tract; for instance, in the correction of failure of the male sex organ to develop properly. The same type of split skin graft, covering a rubber tube, has been used successfully in the formation of the female sex organ when this structure has failed to develop. The risk of such a procedure is infinitely less

than that of other methods of forming artificial organs.

Removal of obstructing portions of the prostate gland by procedures carried out through the natural openings with a mortality of less than 1%, has practically superseded the open methods of removal in which the risk was considerably greater. Control of infection in connection with operative or diagnostic procedures

relative to the urinary tract has been importantly improved by demonstration of the value of increased acidification, effected with ammonium chloride and mandelic acid. This, and the more recent use of sulphanilamide, have proved efficient in controlling most of the urinary infections even in otherwise intractable cases. Sulphanilamide must be used cautiously and under the daily supervision of a physician. Conservative surgical procedures directed toward relief of urinary obstruction in the kidney have assisted in the preservation of many hydronephrotic kidneys, as well as in the removal of multiple obstructing renal calculi. In this respect, the use of roentgenoscopic and roentgenographic examinations of the kidney in the operating room, both prior to and subsequent to removal of stones, has been of great assistance in removal of all of the stone fragments.

In surgery of the nervous system physiological knowledge has been applied in treatment of essential hypertension, or high blood pressure which develops without demonstrable cause. Apparently this condition is attributable to vasomotor spasm of the arterial system, caused by abnormal stimuli from the brain and spinal cord reaching the arteries and arterioles through the sympathetic nervous system. Numerous operations have been devised to interrupt these stimuli in order to prevent a large vascular area from receiving excessive vasomotor stimuli as well as to make available a reservoir in these same arteries when the nondenervated arteries and arterioles go into spasm. Adson advocates bilateral resection of the splanchnic nerves, with removal of the upper two lumbar ganglions on each side, effected through a subdiaphragmatic, extraperitoneal approach, in order to denervate the arterial system below the diaphragm. Another advance in this field has been in treatment of intractable sciatica. The cause of this condition frequently had been overlooked until injection of a radiopaque oil into the spinal canal was employed to reveal filling defects opposite the intervertebral foramina. Roentgenographic observations, after the injection, allow localization of protruded portions of a ruptured intervertebral disk. Lumbar or sacral nerve roots are irritated or compressed by these tumour-like masses. Removal of them is effected by excision after laminectomy.

Thoracic surgery, although a relatively new field, has made great progress in recent years owing to better understanding of many physiological problems necessary to function of the vital organs contained within the thorax and to the development of surgical methods that will insure sufficient function of these organs to maintain life during operative procedures on them. It is now relatively common to remove one or more lobes of a lung for certain inflammatory or malignant conditions. It is also possible to remove some tumours and cysts from the lung and adjacent structures, with complete relief of symptoms. Operative procedures have been developed which make possible rectification of certain conditions of the heart as well as those of its pericardial covering; many patients who otherwise would have died are being

restored to health. In cases of herniation of abdominal viscera into the thorax, a condition often called "up-side-down stomach," the herniated viscera are replaced and the abnormal opening in the diaphragm is repaired. This operation is now done relatively often. Marked advance has been made in surgical treatment of pulmonary tuberculosis and surgery is now one of the greatest aids in fighting this dreaded disease.

Various physical principles have been applied in designing operating room equipment. Operating rooms are conditioned with filtered air which is subjected to ultra-violet radiation both before and after entering the operating room. The latter has been accomplished by means of lighting apparatus. When this apparatus is used the operating personnel must wear special goggles, masks, gowns, and so forth.

Further improvement in the field of anaesthesia, including intraspinal injection of solutions of procaine has continued to gain in favour both among surgeons and patients. The risk of this method of anaesthesia has been progressively lessened by better understanding of it and by control of decreases in blood pressure by intravenous injections of ephedrine. Introduction of anaesthetic substances which can be injected intravenously has been of great value in short operations wherein abdominal relaxation is not required.

(WA. WAL.)

**Surinam** (Dutch Guiana), a Dutch colony in North-eastern South America; area, 54,291 sq.mi.; language, Dutch; capital, Paramaribo (pop. 52,705); governor, Dr. J. C. Kielstra. Surinam has a population of 148,971 (census of Jan. 1, 1937), excluding an estimated 17,000 Negroes and 3,500 Indians in the jungle. The colony is governed by an appointed governor and partially elected council. The new constitution, in effect July 8, 1937, somewhat broadened the electorate. Surinam has one railroad (length, 137kms.) and fairly good roads in the coast district. External communication is by steamship lines and a bi-weekly air service. Almost half of the foreign trade is with the Netherlands; the United States is second. The chief imports are manufactured goods and foodstuffs; the chief exports are coffee, sugar, molasses, miscellaneous agricultural products, and gold. Gold production in 1936 totalled 443,487 grams. The monetary unit is the Dutch florin (value: approx. 56¢ U.S.). Government expenditure in 1936 was 6,688,875 florins and the revenue but 3,904,577 florins, necessitating a Netherlands government subsidy. In 1936 Surinam had 132 schools (43 government), with 22,130 enrolment, besides 33 Indian and Negro schools in the jungle.

**Swaziland**, A British protectorate in South Africa, bounded N. W. and S. by the Transvaal, and E. by Portuguese East Africa and Zululand. It is administered by a resident commissioner, Mr. Chas. Lamb Bruton, O.B.E., under the high commissioner for South Africa, but during 1937 steps were taken with the object of transferring the protectorate to the Union (*see* SOUTH AFRICA, THE UNION OF). The paramount chief of the Swazis is Sobnuza II, but concessions to Europeans have left barely one-third of the territory to the natives. The administrative headquarters are at Mbabane. Area 6,704 sq.mi.; pop. (1936), Bantu 153,270, European 2,740. There are government and missionary elementary schools. The chief supports the Swazi National school. A motor service on the main routes is run by South African Railways, and one from Goba railhead to Stegi by Portuguese Railways. There are no railways. Maize, tobacco, and citrus are produced, tobacco production in 1936 being 261,794 pounds. Export and import statistics are not available, since Swaziland is, for this purpose, treated as a province of the Union of South Africa; its share of revenue from

customs in 1935-36 was £19,822. A poll-tax of £1.15.0 is paid by all native males, and £1.10.0 for each wife after the first, up to a maximum of £4.10.0. 2s from each unit of tax is credited to the Swazi National Fund for education and social services. Currency is as for the Union of South Africa. Total revenue and expenditure for 1935-36 were £158,479 and £135,255 respectively.

**Sweden**, kingdom of northern Europe, member of the League of Nations. Bounded N. by Norway, E. by Finland and Baltic waters, S. by the Baltic sea, W. by Baltic waters and Norway. Capital, Stockholm. Ruler, King Gustaf V (born, 1858; succeeded, 1907), National flag, a yellow St. George's cross on a blue ground.

**Area, Population, and Cities.**—Area: including lakes (3,505) 173,347 sq.mi.; population: (1930 census) 6,142,191; (1935 estimate) 6,249,489:

Government	Area (sq.mi.)	Population (1935)
Älvsborg . . . . .	4,919	321,433
Blekinge . . . . .	1,173	146,315
Gävleborg . . . . .	7,609	281,096
Göteborg and Bohus. . .	1,948	469,908
Gotland . . . . .	1,220	58,049
Halland . . . . .	1,901	152,863

Upsala . . . . .	2,059	139,137
Värmland . . . . .	7,427	273,282
Västerbotten . . . . .	22,838	214,914
Västernorrland . . . . .	9,924	282,022
Västmanland . . . . .	2,609	162,009

Swedes are prevalently of pure Scandinavian stock; practically all belong to the State-recognized Lutheran Protestant Church.

Elementary education is compulsory and free. Elementary pupils (1934): 642,436; in secondary and high schools (1935): 53,000; in Upsala and Lund universities (1936): 6,200. Principal towns (1936): Stockholm (533,884), Göteborg (busiest port; 258,387), Malmö (141,485); two others had over 50,000, and 12 more over 25,000.

**History.**—The king wields executive power, under advice from a council of State (premier and ten ministers), and, on legislation, a diet (first chamber, 150, elected for eight years; second chamber, 230, elected for four years by universal suffrage and proportional representation), Social-Democrats hold majorities. The (1936) ministry is Socialist-Agrarian; premier, Hr. P. A. Hansson. The year was regarded as prosperous. Prince Carl, nephew of the king, renounced his rights on marriage (Stockholm, July) to Countess Elsa von Rosen.

**Trade, Communications, and Finance.**—The percentage (below 50) of the population living by agriculture (hay, oats, potatoes, beets) is decreasing. The forests are valuable. Mining remains the chief industry; iron ore is mainly exported. Timber and timber-products (including paper and pulp) and machinery are leading exports. Exports—1,505 million kronor (£75,000,000)—and imports—1,619 million kronor (£81,000,000)—for 1936 showed increases, maintained in half-1937.

Of about 10,500 miles of railway, rather less than half are

State-owned (and, of that, 35% electrified). Telegraphs and telephones are well developed. Commercial aviation (616,000 miles; 22,960 passengers—1935) is subsidized. Mercantile marine (1936): 1,259 ships (1,514,917 tons).

The unit of currency is the (nickel) krona (at par, 18.16 kronor = £1 = \$4.87). Budget estimates (1937-38): 1,291,486,000 kronor. The National Bank, guaranteed by the diet, returned a balance-sheet (Dec. 1936) of 1,578,088,777 kronor, notes in circulation representing little over half. Savings banks (post office and other) had nearly 4,500 million kronor on deposit in 7,218,091 accounts.

**Defence Forces.**—The army (conscript and volunteer) had (1936) 1,688 officers and 21,813 other ranks (potential total, 575,000); the air force, 850 all ranks (93 machines); the navy, 310 officers, 3,800 other ranks (seven coast defence ships, two cruisers). Defence expenditure: 126 million kronor. The July reorganization authorized substantial additions to the navy. (See also WATER POWER.)

**Swedish Literature:** see SCANDINAVIAN LITERATURE.

**Sweepstakes:** see HORSE RACING.

**Sweet Potatoes.** The 1937 crop of sweet potatoes in the United States was estimated by the Department of Agriculture as 75,393,000bu., compared with 64,144,000 in 1936 and the five-year (1928-32) average of 66,368,000 bushels. Adequate rainfall over most of the producing area and favourable conditions at harvest time resulted in a yield of 89.4bu. to the acre as against 78bu. in 1936 and a five-year average of 88.5 bu. to the acre.

The acreage harvested was 843,000ac. in 1937 and 822,000 in 1936; for the five-year (1928-32) average, 771,000 acres. In Georgia there was an increased acreage of 12% and a crop of about 7,875,000bu. compared to 6,630,000bu. in 1936. In Louisiana acreage was decreased about 20%, and production was approximately 8,800,000bu. as against a crop of 7,797,000bu. in 1936. North Carolina production approximated 8,100,000bu. in 1937, compared with 7,560,000bu. the previous year. The Alabama acreage for 1937 was 20% larger than in 1936 and production about 7,200,000bu., compared to 6,160,000bu. in 1936. New Jersey production was estimated at 2,320,000bu. in 1937, and 2,400,000 in 1936. In Tennessee the 1937 acreage was 15% over 1936. (See also CHEMISTRY, APPLIED.) (S. O. R.)

**Swift, Sir Rigby Philip Watson** (1874-1937); British justice; born at St. Helens, Lancashire. He was educated at Liverpool and London university, and was called to the bar in 1895, joining the Northern circuit. He became a K.C. in 1912, was recorder of Wigan from 1915 to 1920, and was made a bencher of Lincoln's Inn in 1916. From 1910 to 1918 he represented St. Helens in Parliament as a Conservative. In 1920 he was knighted and was appointed judge of the King's Bench division, in which he reached the position of senior judge. Mr. Swift was an outspoken critic of the

SWEDEN: Industrial production index (The Annalist)

English divorce and betting laws. He died at Crowborough, Sussex, Oct. 19, 1937.

**Swimming** made notable strides in 1937. Increasing recognition of its value in life-saving and physical culture was manifest the world over. Everywhere there was a greater tendency toward making natatorial courses an integral part of the curricula at schools and universities. Germany decreed that all her boys and girls must learn to swim before the age of nineteen.

As a competitive sport, swimming progressed apace; the number of contestants grew; average skill improved materially; in most countries many national records were broken; quite a few world's records also fell. Foremost internationally were the exploits of Miss Ragnhild Hveger, of Denmark, and Ralph Flanagan, of the United States. Miss Hveger, a 17-year-old marvel, shattered nearly a dozen world's standards, some several times. Her greatest feats were to slash the marks for 440-yards free style from 5min. 22sec. to 5min 12.8sec. and 400-metres back stroke from 5min. 59.8sec. to 5min. 44.5 seconds. Flanagan swam his best in cutting the world's record for one mile from 20min. 57sec. to 20min. 42.6 seconds. On the way he passed 1,650 yards in 19min. 18.2sec., outdoing Hiroshi Takahashi, of Japan, who set 19min. 37.8 sec. as the year's fastest time for 1,500 metres (1,640.4 yards), the Olympic route.

Noteworthy results marked America's 100-metre free style championship for women. The times of the four leaders, the Misses Elizabeth Ryan, Toni Redfern, Claudia Eckert and Mrs. Olive Mucha, totalled 4min. 35 seconds. Dutch girls won the last Olympic 400-metre relay in 4min. 36 seconds. Five American champions competed in Japan. Three defeated Nippon's topnotchers, Adolph Kiefer at the back stroke, Elbert Root in diving and Miss Katherine Rawls in crawl and dorsal tests. Jack Medica and John Higgins were defeated in free style and breast stroke events. Hungary won the water polo Horthy Cup, emblematic of European supremacy, and reaped high honours also at the international university swimming championships in Paris.

(L. DE B. H.)

**Swing Music:** see DANCING; JAZZ; SONGS, POPULAR.

**Switzerland**, a confederation of west-central Europe, member of the League of Nations, bounded N. by Germany, E. by Austria, S. by Italy, and W. by France. Capital, Bern (fourth city in population). President (1937), Dr. Giuseppe Motta. National flag, a small white Maltese cross on a red ground.

**Area, Population, and Cities.**—Area: 15,944 sq.mi.; population (1930 census): 4,066,400:

*Canton	Area (sq. mi.)	Population (1930)	*Canton	Area (sq. mi.)	Population (1930)
Aargau	542	259,644	Nidwalden	106	15,055
Appenzell (Ext.)	94	48,977	Obwalden	190	19,401
Appenzell (Int.)	67	13,988	St. Gallen	777	280,362

			Zürich	668	617,706

\*The name of each canton is given in the language predominant in it.

Protestants were returned as 57% of the population, Roman Catholics as 41. Almost three-fourths spoke German, one-fifth French, one-sixteenth Italian.

Elementary education is obligatory and free. Statistics (1934-35): 4,333 primary schools with 473,040 pupils; 713 secondary

ELIZABETH RYAN, U.S. woman champion, 100-metre, free-style swimmer

schools with 77,257; (1935-36) seven universities with 8,738. Zürich is the largest town (1933: 312,600); Basel, Geneva, and Bern exceeded 100,000; three others, 50,000 (1930).

**History.**—Each canton is autonomous, the Federal government ruling only in war and treaties, and supervising the national services. Election results, Oct. 27, 1935: National Council (elected by adult suffrage and proportional representation for four years), Social Democrats 50, Radicals 48, Catholics 42, Agrarians 21, other parties 26. Council of States, Radicals 15, Catholic Conservatives 18, other parties 8. The seven members of a Federal council act as ministers.

Switzerland's role of hostess for international conferences (apart from the League of Nations, since 1936 in the new Palais des Nations, Geneva) was sustained by the meeting of Powers at Nyon, occasioned by the Mediterranean situation arising from the war in Spain. In June Geneva was discovered to be in use as a centre for smuggling arms via France to Spain. In November the principle of popular initiative (see *Encyclopædia Britannica*, vol. 21, 677-78) was invoked for a proposal to amend the constitution so as to re-establish the complete neutrality, economic as well as military, existing prior to 1914. It was foreseen that this would raise the issue of sanctions, and so of membership of the League of Nations. In April the Communist Party was banned in Neuchâtel canton—the first suppression in history of a political creed by vote; in June, Geneva canton followed suit. In July, Romansch, a Latin derivative, spoken by some 50,000 in eastern cantons, was declared an official language (the fourth). In March exceptionally heavy weather gave rise to disastrous avalanches and some perilous rescues therefrom.

**Trade, Communications, and Finance.**—Almost half the area is unproductive or forest land (reafforestation is active); most of the remainder is under grass and pasturage (cheese and condensed milk are leading industries); agriculture engages over one-fifth of the population. Pisciculture is pursued; 18 cantons produce wine. Clocks are an outstanding manufacture (nearly 17 million in 1935; an increase of 2½ million on 1934). Imports (1936): 1,266,262,000 fcs. (£58,680,000)—a slight fall; exports: 881,633,000 fcs. (£40,816,000)—a slight rise. Britain took one-seventh (watches and silk goods leading). Half-1937 figures showed substantial increases.

Of the State railways (3,218 miles) 1,313 miles had been electrified in 1935. Road mileage: 10,200. Air transport is developing: 1,055,635 kilometres; 21,485 passengers; 173,424 kilos mails and goods (1936). Posts, telegraphs, and telephones (including radio) are highly developed.

Unit of currency: (silver) franc (at par 25.22 fcs. = £1 = \$4.87). Budget expenditure (1936): 540,497,667 fcs. The National Bank has the right of note-issue; in circulation (March 6, 1937): 1,355,431,000 fcs. Total public debt (including railways): 5,448,015,000 fcs.

**Defence Forces.**—Service in the militia is compulsory: under

training, 46,200—period, 88 days; aeroplanes, 160; military expenditure (1936), 98,500,000 fcs. (See also WATER POWER; ROMANSCH.)

**BIBLIOGRAPHY.**—E. Gagliardi, *Geschichte der Schweiz* (3 vols.; Zürich, 1933); M. Reymond, *Histoire de la Suisse* (3 vols.; Lausanne, 1933). (H. Fw.)

**Sydney.** Capital city of the State of New South Wales (*q.v.*) Australia; situated on a natural harbour (Port Jackson) extending 20mi. inland and having a water frontage of 188mi., at the mouth of the Parramatta river; the largest city and port of Australia; distance from London, 11,630mi. Pop. (Dec. 1936), including suburbs, 1,267,350, comprising 47.3% of the population of New South Wales; area, 154,688 acres. Shipping (1935-36): tonnage entered, 10,479,774 tons net; cargo discharged, 1,319,633 tons (478,974 tons interstate); cargo shipped 1,356,386 tons (190,649 tons interstate). The volume of shipping entering the port in 1936-37 constituted a record, as did the tonnage of goods handled.

Sydney enjoyed a real-estate and building boom in 1937. Sales of real estate in the city and suburbs in the nine months to September were 519% above depression level (1931); in some areas inquiries for suburban properties exceeded the number recorded in the boom years 1927 and 1928. Trolley buses were inaugurated, and big extensions made to suburban bus-services (State-owned). Progress was made with the City Railway, running underground from Circular Quay. The accounts of the Sydney Harbour bridge showed a surplus for the first time in 1936-37, income being £477,858 (including £402,702 from tolls), and expenditure £415,810 (including £334,432 for interest). For 1937, a surplus of £3,451 was estimated, although the levy on local councils was abolished.

Preparations were made for the celebration in Sydney in 1938 of the 150th anniversary of the founding of Australia.

**Syphilis:** see VENEREAL DISEASES.

**Syria and Lebanon.** These levantine republics are administered under a French mandate, pending their acquisition of independence. The president of Syria is Hashem Bek el Atassy, elected Dec. 1936, and that of the Lebanon Emile Eddeh, elected Jan. 1936. Total area, *c.* 57,900 sq.mi.; total population (1935), 3,630,000. Syria is predominantly Mohammedan, and Lebanon Christian. Capitals: are Damascus (Syria) and Beirut (Lebanon). (X.)

The year 1937 was dominated by the expectation of a change of régime. On Sept. 9 and Nov. 13, 1936, respectively, treaties

of friendship and alliance had been signed in Paris between France and Syria, and between France and the Lebanon. The texts of these treaties have been ratified by Syria and Lebanon respectively; they await the ratification of France.

The Syrian and the Lebanese treaties present totally different characters. The Syrian treaty brings into effect a liquidation demanded and obtained by a nationalist Pan-Arab Government. The result of the Lebanese treaty, on the other hand, would be to consolidate French protection, replace the mandate by a contractual régime which is not unlike that of the protectorates. While the Muslims of Syria were anxious to free themselves from French tutelage, the Christians of the Lebanon, anxious for their independence and for their very lives, wanted to keep the protection of France. For, in those regions, the States are purely artificial constructions, and do not correspond to any human reality. The only reality is religious faith. The State of Syria considers itself too small, and wishes to join a confederation of all the Muslim countries of the Near East. The Christian State of Lebanon, on the other hand, considers itself too big, and would willingly abandon to Syria the southern and eastern districts whose population is chiefly Muslim.

In Aug. 1937 Christians were massacred at Amouda, in Upper Jezireh, on the borders of Turkey and Iraq. The aggressors were Kurds, said to have been encouraged and financed by the Arab Government in Damascus. (R. PIN.)

**Szymanowski, Karol** (1883-1937), Polish composer, considered the greatest since Chopin. Since 1922 he had been professor of composition and director of the State conservatory at Warsaw. The most famous of his later works was the ballet "Harnasie" based on Polish folk songs and dances, which was received with overwhelming success in Paris a few months prior to his death and was performed in New York city but two days after he had died. Within recent years he had also written the masques *Scheherezade*, *Tantris the Fool* and *Don Juan's Serenade*, the chorale *Stabat Mater*, and the opera *King Roger*. He died near Lausanne, Switzerland, March 29, 1937.

**Table Tennis:** see PING-PONG.

**Tahiti:** see PACIFIC ISLANDS, FRENCH.

**Taiwan:** see FORMOSA.

**Tajik S.S.R.,** a member of the U.S.S.R. (*q.v.*). This Central Asiatic Soviet Republic, the nearest to India, borders on the republics of Uzbekistan and Kirghizistan, on China and Afghanistan. The capital is Stalinabad (formerly Diushambe), and the national flag is a red ground, with a gold hammer and sickle and name of the republic in the top left-hand corner. The leading cities (1936) are Stalinabad (49,600), and Leninabad (67,700).

**Area and Population.**—Area: 144,000 sq.km. of almost entirely mountain country, with, in the east, the Pamirs, the highest mountains of the Soviet Union, with vast glaciers. Population (1933), 1,333,000 (rural, 1,187,000, urban, 146,000), of whom 78.4% are Tajiks and 17.9% Uzbeks. The total number of pupils in schools (1936-37) was 199,000.

**History.**—The Sixth Extraordinary Soviet Congress at Stalinabad adopted on March 1 the new constitution of Tajikistan, according to which the republic includes 59 districts, besides the Gorno-Badakhshan autonomous province. The capital, Stalinabad, and the town of Leninabad form special administrative units. About 95% of the population took part in the elections to the Supreme Council of the U.S.S.R. At the beginning of October the president, the premier, and three other commissars of the republic

were removed from office as "enemies of the people," bourgeois Nationalists and Fascist agents, and arrested on charge of treason.

**Trade and Communications.**—The sown area (1936) was 2,616 sq.mi., and in 1937 89.9% peasant households were collectivized. Wheat, cotton plantations, fruit farming in the mountain valleys in the west, and cattle breeding in the mountains, are the main activities.

Natural resources include water power, recently discovered minerals through the expeditions of the Academy of Sciences, non-ferrous metals, gold, silver, lead, oil, and coal. The retail trade turnover (1936) was 0.6 milliard roubles. Exports included cotton, fruits, silk, wool, tin, lead. There is a railway line from Stalinabad to Termez (253km), and several mountain motor roads. (S. YAK.)

**Tammany Hall.** New York city's Democratic organization experienced the most disastrous year in its history during 1937. Although an important mayoralty election was approaching, the first six months were wasted in factional disputes. Attempts to oust James J. Dooling as leader failed despite constant criticism of his control. Mr. Dooling died on July 26 just as plans were being laid for the mayoralty primaries. Internal dissensions were not ended by Dooling's death. N.Y. Representative Christopher D. Sullivan was elected as leader, but opposing factions remained whose members refused to back U.S. Senator Royal S. Copeland as the hall's choice for mayor. Judge J. T. Mahoney, a Tammany district leader, resigned to make the race against the organization's choice; while Copeland entered the Republican as well as the Democratic primaries. The primaries of Sept. 16 marked a severe defeat for Tammany, for their candidate was badly beaten by both the mayor and Judge Mahoney. Defeated in the primaries Tammany turned to the support of Judge Mahoney, although the Democratic contest had made close co-operation impossible. They met with no greater success as Mahoney lost to Mayor La Guardia by 450,000 even after receiving the support of Postmaster General Farley, Senator Wagner and Governor Lehman. Such a result indicated how greatly Tammany's influence had waned. So unpromising was the outlook for the future that the defeated candidate proposed abolition of the organization.

**Tanganyika,** formerly German East Africa, a territory held since 1920 by Great Britain under mandate from the League of Nations, bounded on the N. by Kenya and Uganda, on the W. by the Belgian Congo, on the S.W. by Northern Rhodesia and Nyasaland, on the S. by Mozambique, and on the E. by the Indian ocean. Its estimated area is 366,000 sq.mi., and its pop. (1935) about 5,135,000, including some 8,500 Europeans and 33,000 Asiatics. The governor is assisted by a nominated executive council and a legislature with a majority of official members. Dar-es-Salaam (pop. *c.* 30,000) is the administrative centre. The principal native language is Swahili; there are many Mohammedans and native Christians. There are two State schools and about 12 State-aided private schools for Europeans, over 50 Indian schools, and about 80 government schools for natives. Railways extend nearly 1,400 mi., and there are about 17,000 mi. of roads fit for motor traffic; 48 government and 6 private aerodromes exist. A great deal of the territory is under forest; the most valuable mineral produced is gold. Revenue (mainly from taxes, customs, etc.) for 1936 was estimated at £1,946,000, and expenditure at £1,925,000. Exports—for which the chief were sisal, cotton, and coffee—for 1936 were valued at £4,805,000, and imports at £3,201,000. East African currency based on the silver shilling of 100 cents is in use. In

1937 a company was formed to lease land in the southern highlands for cattle-farming by settlers with co-operative marketing and social amenities. Some rioting took place in September in the Moshi district, owing to native dissatisfaction with the prices received for coffee, the buildings of the Kilimanjaro Native Coffee Union being destroyed. It was announced at the end of the year that the governor, Sir Harold McMichael, would relinquish his post in Feb. 1938, on appointment as high commissioner for Palestine.

**Tangier.** An international zone of Morocco (*q.v.*) governed, under the sultan, by an international assembly. Area *c.* 225 sq.mi.; population, *c.* 70,000. The zone of Tangier is directly affected by the Spanish Civil War owing to its important position on the Straits of Gibraltar. In March, two Italian soldiers were wounded in a quarrel with Spanish Communists, and the Italian press accused of partiality the French magistrates in charge of the inquiry. France, on the other hand, suspected Italians and Germans of an unscrupulous use of propaganda in order to detach the people of Tangier from the sultan, their ruler, by attacking his representative the *mendoub*, and thus threatening the unity of Morocco, which was laid down in the Act of Algeciras.

**Tanks:** see ARMIES OF THE WORLD: *Aeroplanes and Tanks*; MUNITIONS OF WAR: *Tanks*.

**Tanner, Henry Ossawa** (1859–1937), American Negro painter, especially on religious subjects, is represented in such collections as the Luxemburg, the Metropolitan Museum of Art and the Chicago Art Institute. Born in Pittsburgh, June 21, 1859, the son of a bishop of the African Methodist Church, he studied art under Thomas Eakins in Philadelphia; but worked in a flour mill, taught at Clark university in Georgia, and was a photographer before winning recognition and backing as an artist in 1890. Some of his most important paintings are "Sodom and Gomorrah," "L'Annunciation," "The Three Marys," and "Two Disciples at the Tomb." He was made a Chevalier of the Legion of Honour and won many prizes for his work. He died in Paris, May 25, 1937.

**Tantalum:** see CHEMISTRY, APPLIED.

**Tariffs.** The history of tariffs and import quotas in 1937 was disappointing to those who hoped that the increase of world prosperity would bring about a reduction of the barriers to trade which had been erected during the depression. Increases of tariffs and intensification of quota systems almost balanced their opposites. More encouraging was the gradual widening of the area of previous reductions, or of intermediate tariff concessions, through the extension of the most-favoured-nation régime. There was also a tendency to replace clearing agreements by the less restrictive payments agreements with countries practising exchange control.

There was no major revision of the tariffs of either of the world's two leading trading nations, the United Kingdom and the United States (but see TRADE AGREEMENTS: *Great Britain*). The first place on the list of countries that lowered tariffs in 1937 was taken by Canada. In February she concluded with the United Kingdom a trade agreement, under which she reduced preferential duties on about 150 items and sub-items of her tariff list, representing roughly 40% of her imports from the United Kingdom. The Canadian budget contained further tariff reductions, including many on the intermediate and general lists, to which the way had to some extent been opened by the

agreement with the United Kingdom. In October, as a result of trade agreements with Australia and New Zealand, Canada lowered preferential duties on mutton and lamb, canned meats, wines, preserved eggs and fruits, hops, gelatine, and other articles.

The United Kingdom, in return for Canadian concessions, lowered duties on silk stockings and reed organs. Two other United Kingdom tariff moves had special causes. As a result of the shortage of steel, the protective duties on certain categories of iron and steel, imported under the quota agreement with the European cartel, were suspended in May, such goods paying thenceforward only the general duty of 10%. In April, world wheat prices having risen to the level of the British guaranteed price, quota payments on wheat were suspended; they were, however, reimposed in September.

Australia was another country of the British commonwealth that lowered barriers to trade in 1937. A wide revision of her tariff in June resulted in lower duties, especially preferential and intermediate rates, on many articles, including confectionery, felt piece-goods, iron pipes, tiles, and sanitary ware. In most cases, a proviso was attached allowing proportionate increases of duty if the Australian pound should appreciate. Reductions later in the year included, among lesser tariff items, linen piece-goods. In December, Australia decided to replace the import licensing system, which she had adopted under her trade diversion policy, by adequate protective duties, removing forthwith the restrictions on goods not competitive with Australian industry. The import quotas on motor chassis, however, were retained. The budget of the Union of South Africa also lowered a number of duties, including those on imitation leather, cash registers, drain-pipes, motor spirit, essential and mineral oils, clocks and musical instruments. Provision was further made for rebate of duty on a wide range of goods when used as material for local industry. New Zealand, under an agreement with Germany, reduced intermediate duties on cameras, clocks, field glasses, builders' hardware, medicines, etc., and abolished primage duty on other items. Southern Rhodesia, revising its tariff in April, lowered duties on many goods imported from the United Kingdom. There were sundry consolidations and changes of tariffs in the British colonial empire, the balance being slightly upward. The Irish Free State continued to raise higher duties, the articles affected including wool yarns and linen and cotton piece-goods. She also extended her system of quota restrictions.

In Europe, the most important tariff changes were those of France. Budgetary difficulties and a great increase of imports caused her in July to impose a general increase of customs duties by 13%, together with some specific increases, notably on coffee and tea. There was, however, a long list of exceptions, which was extended as a result of the Franco-German trade agreement. In the later months of the year duties were increased on certain chemicals, millinery material, yarns and twine, bricks, tiles, drain-pipes, pottery, post cards, electric batteries, and tissues of linen, hemp, silk, and rayon, etc., etc.

The State-controlled import régimes of Germany and Italy continued without major modification. It was significant, however, that the big cuts in the German duties on rye, wheat, barley, and oats, which had been made temporarily in Dec. 1936, were prolonged indefinitely in August, while temporary cuts in the duties on fodder and certain fruits were announced in March; and that in Italy the reduced butter duty introduced in Dec. 1936 was followed in January by lower duties on wheat, maize, flour, and other wheat products. It was announced in July that all goods from Italian East Africa, except coffee, would be free of duty on import into Italy. Another notable German move was the large increases of duty imposed in June on rubber.

In eastern and central Europe there was, on the whole, a cer-

tain relaxation of trade restriction in 1937. In January, Czechoslovakia announced an easing of her system of exchange permits and import licences, and in the following months the requirement of exchange permits was abandoned altogether, though certain goods were added to the list requiring import licences. Switzerland removed some import restrictions in January. After adding a number of fresh items to the quota list in March, Rumania removed from it most categories of iron and steel in April, and hides, sulphur, and metallurgical coke in July. A contrary development was the levying of new consumption taxes on coffee, beer, cotton goods, and certain metal products. Poland, as a result of her trade treaties with Germany and France, lowered duties on certain machines, toys, wines, fancy leather, and hosiery, *inter alia*. Various temporary reductions in Polish tariffs were also made. Bulgaria imposed higher duties on toothbrushes, trimmings, asphalt, yarns and threads, etc., but her new tariff of Sept. 1936 had involved many and considerable reductions. Hungary added extensively to her import restrictions in Feb. 1937, and in January Greece adopted a thorough-going revision of her import control system in the general direction of greater restriction. She followed this with higher duties on rice, accumulators, fertilizers, and other goods.

Turkey also modified her import restriction system in 1937 (July), but in the opposite sense. Among other provisions, unrestricted import would thenceforward be allowed from countries with which Turkey had (a) a net favourable trade balance, or (b) a clearing or similar agreement granting her a margin of not less than 20% between imports and exports. The first category included the United States and the second the United Kingdom. Among Turkey's many tariff changes during the year were increases on leather, shoes, woollen tissues, knitted goods, cement, glassware, iron and steel wire, iron pipes, coke, and accumulators; and decreases on paints and varnishes, some hides and leather manufactures, raw wool and woollen yarns, cotton and linen yarns, jute, timber, iron ore, plate glass, and musical instruments.

Among the northern European countries, there was the same lack of an obvious trend in tariff and quota policy. (*See, however, the new arrangement among the Oslo group of Powers, under TRADE AGREEMENTS: Great Britain.*) Sweden, along with some decreases, imposed higher duties on grapes, iodine, and leather for glove-making, and decreed that milk and dairy products might be imported only with a permit from the state agricultural board. Belgium made a number of adjustments, some upward and some downward, in her tariff, including higher duties on certain footwear (November). She also extended her import licence system to margarine and edible fats. The Netherlands was content generally to prolong her quota system. The Netherlands East Indies extended their quota list to include a number of new commodities; and submitted their tariff to a general revision which included a substantial cut in the duties on cotton piece-goods, underclothing, stockings, etc., but also a number of increases.

Outside Europe, apart from the changes already recorded, the most important development was the restriction of imports by Japan after the outbreak of the war in China. In August she imposed higher duties on motor cars and parts thereof, and certain other articles, and in October she introduced a system of import and export licences affecting most foodstuffs, cotton, wool, leather, chemicals, jute, silk, flax, yarns, various tissues, clothing, paper, cement, watches, cycles, motor-cars and engines, etc., etc. Of the Latin-American countries, Bolivia raised her tariff by 60% in March; Mexico in January modified 677 important tariff items mostly upward; Cuba increased the duties on vegetable oils (March); Panama put a number of articles on the free list, and lowered the duties on various chemicals and infant foods, but raised those on soap, hair creams, and sparkling wines (March);

Venezuela made a number of changes in each direction (March); Chile imposed higher duties on whisky and on motor-cars, chassis, tires and parts (November); Salvador, under her trade agreement with the United States, lowered duties on ham, fruits, sawn wood, rubber tires, and gramophone records (April), and later (July) those on celluloid, sanitary ware, and other articles. (H. V. H.)

**Tasmania,** a State of the Australian Commonwealth, forming an island 26,215 sq.mi. in area to the southeast of the mainland, from which it is separated by 140mi. of Bass Strait. The State governor, representing H.M. King George VI, is Sir Ernest Clark, K.C.B. Population (March 1937), 233,191, comprising 3.4% of the population of Australia. Capital, Hobart; population, with suburbs (1937), 64,480. The premier of a Labour government is Mr. A. G. Ogilvie, K.C.

**History.**—A general election for the House of Assembly took place on Feb. 20, 1937. The resulting party strengths were as follows (results of 1934 election in parentheses): Labour, 18 (15); Nationalists, 12 (14); Douglas Credit, 0 (1). A bill for the reform of the legislative council was accepted unanimously by the House of Assembly, where the Government and the Opposition reached a compromise, and was brought before the Council late in 1937. It abolished the council's power to reject money bills, but provided that, on the initiative of the council and with the advice of the chief justice, the governor might strike out of a money bill any item of expenditure not within the category of ordinary government service. Should the legislative council reject an ordinary bill, the measure empowered the Government to seek a dissolution.

In 1936-37 the Tasmanian building industry had one of the most expansive years in its history. Reckoned per head of population, the value of building permits in Hobart exceeded the equivalent figures for the four greatest cities of the Australian mainland. Other economic indices also moved to prosperity levels in 1937 (*see below*). An important new development in transport was the carriage of mails by air across Bass Strait without surcharge. Four crossings were made daily, and the normal mail traffic was estimated at 25,000 letters daily in each direction.

**Trade, Industry, and Finance.**—Production in 1936-37 was valued (net) as follows (preliminary figures): agricultural, £2,009,000; pastoral, £1,567,000; dairying, poultry, and bees, £853,000; forestry, fishing, and trapping, £657,000; mining, £1,976,000; total, primary industry, £7,062,000; manufacturing industry, £4,209,000. The Government's economic adviser estimated that in 1936-37 about 5,850 persons were without normal full-time employment, representing about 9% of those available. Corresponding figures for 1935-36 were 6,500 and 10%. There is considerable seasonal unemployment in the State.

The budget for 1936-37 yielded a surplus of £44,906, instead of the small deficit that had been estimated. For 1937-38, revenue was placed at £3,515,201 (against £3,488,524 received in 1936-37), and expenditure at £3,512,569 (against £3,443,618). Land tax was remitted on agricultural, pastoral, or the like properties having an unimproved value of less than £3,500; the loss of revenue was made good by increases of tax on non-rural lands. Net loan expenditure, 1936-37, £814,950. (H. V. H.)

**Tate Gallery:** *see* ART EXHIBITIONS; ART GALLERIES AND ART MUSEUMS.

**Taxation.** The chief characteristics of recent developments are (a) the process of "steepening" the progression in taxes on wealth and income; (b) the use of taxation

as a means of achieving other social or governmental ends than revenue; and (c) the development of taxes on sales or turnover.

Progression in taxation achieved by the higher percentages charged upon the wealthier people is no longer based in principle merely upon the idea of "equal" sacrifice, but is advocated widely as a means of redistributing wealth. Out of the fund so provided by the rich, the social services and pensions of the poorer members of the community are financed. It is urged that it is better, under an individualist system of society, not to try to fetter the making of profits and the personal initiative, but to allow the fortunes to be made and then to take high toll of them for social purposes. In consequence, at the highest ranges or "brackets," rates of 60% or more are accepted as reasonable, and an average rate over the whole approaching 50% is not uncommon. Nor are people any longer greatly shocked to see that when "death duties" are reduced to an annual equivalent, the total annual taxes for a wealthy man may exceed 100%, inasmuch as the keeping of individual capital intact in large blocks is no longer thought a sacred duty. Moreover, the social value of excessive saving by the rich is called into question in many fields of economic analysis. A general consequence of the high rates is the development of ingenious methods of legal avoidance—by establishing private corporations or companies (especially abroad) which receive and accumulate the income, and by various types of trusts—and the continual struggle of the legislative side to circumvent and discourage these devices.

Accompanying the sharper progression at one end of the scale we have a spread of devices at the lower end to make direct taxes reflect more exactly the personal status of the taxpayer in the compulsory use to which he has to put his income, *e.g.* allowances for children, for housekeepers, for dependent relatives, for sickness, and the like. In most advanced countries the income taxes are approximating to a greater similarity than formerly, although there are still wide disparities. The difference between the treatment of "capital" profits or gains in the United States compared with British and European systems is a striking instance.

The developments indicated have now led into a wide-spread view that taxation expedients are rightly used to promote non-fiscal objects. For long the only field in which this was prevalent was that of protection of particular industries by customs duties, and now that Britain, since 1931, has given up taxation for revenue only, the arrangement of tariffs to develop certain economic ideas is general. But tariffs have also developed widely as defences against a non-industrial competition—the competition of depreciated currencies. When a currency in country A has been "devalued," it has to give in exchange more units for a given currency unit in country B which has not altered its currency. An exporter from A to B gets the same price in B's currency as before, but this exchanges for more units of his own, and if he has not to pay in rent, interest, and wages a fully increased number of his own units, he has a greater margin of profit in his own units. This enables him to reduce prices in B, and become a formidable competitor—at any rate for a time. To ward B off, A then increases the tariffs on B's goods. These defensive tariffs in one form or another have multiplied greatly. Special taxes on income going abroad are designed to achieve ulterior objects, such as discouraging investment by foreigners in the home securities; the 10% recently applied in the United States is an example. A tax on undistributed profits of corporations is intended to prevent hoarding by companies, which is regarded as deflationary, and to push purchasing power into the hands of the stockholders, so that their spendable incomes will be increased. This is the use of taxation as means to achieve special economic ends. As a rule they have unexpected repercussions and are clumsy means to the end desired. Perhaps the most thoroughgoing use of taxes to

promote social objects or hinder social tendencies has been elaborated in Germany. The object of the legislature has been "to reorganize taxes to make them fit the policy of national socialism, with reference to population, social welfare, economics and national socialist philosophy." As a consequence there are taxes on bachelors and spinsters to change their numbers and provide funds for marriage loans; new capital equipment in businesses at particular dates is favourably treated; automobiles purchased at particular times are differentially treated; employment of girls is encouraged; the taxation of partnerships is reduced and that of companies increased to stimulate personal responsibility.

The growth of taxes on sales has been remarkable, and there is no instance in the whole history of taxation of such a rapid development. In a few years over 30 nations had adopted them, and in the United States between 1929 and 1934 the spread was rapid. In France many commodities have been specially excepted, to be subject to special taxes, and in general the tax requires no exact figures or evidence—it is based on estimates, with outward signs. It causes wide changes in business methods and tends to favour large integrated companies. In the United States, probably the decline of the personal income tax in the depression of 1931–35, with the necessity to maintain and even increase revenues, was an important reason for the spread, and the reduced valuations for the State property taxes were another cause. In North Carolina, for example, the policy for schools seems to have been closely related to the sales tax. The experiments in the different States are widely different. Great Britain has not adopted it, because it is "regressive" on the poorer classes, but it is found in the majority of modern States, and when once it has been adopted it is often modified but rarely abolished. (*See also EXCESS PROFITS TAX; GASOLINE TAX; GIFT TAX; PROCESSING TAX; SALES TAX; STATE LEGISLATION: Tax Legislation.*) (J. S.)

**Tea.** During the years 1929 to 1932 stocks of tea throughout the world mounted rapidly, prices fell, and it was clear that world supplies were becoming far in excess of world absorption. These conditions gave rise to the international tea regulation scheme promoted on April 1, 1933, to control supplies from the main tea-exporting countries, India, Ceylon, and the Netherlands East Indies, and still in existence. The other countries, notably China, Japan, and Formosa, and, to a lesser extent, French Indo-China, Nyasaland, Kenya, and other African countries which produce and export tea, are not yet parties to the regulation scheme, while the tea produced by Russia in the Caucasus, is all consumed locally. A "standard export" figure was fixed for each of the three regulating countries, and each year they are allowed to export a certain percentage of that standard. Since 1933 the percentage has been as follows: 1933–34, 85%; 1934–35, 87½%; 1935–36, 82½%; 1936–37, 82½%; 1937–38, 87½%.

During the current season stocks fell very considerably, with a corresponding rise in prices, and on Nov. 30, 1937, it was announced that the figure of regulation for the year 1938–39 would be 92½% of standard. If it is proved that the world's markets are able to absorb this increased quantity, it will be seen that the industry is moving in the direction of de-control.

The following table gives the total exports of tea from producing countries:

Quantities in Million Lbs. Year Ending March 31

	Regulating Countries				
	1932-3	1933-4	1934-5	1935-6	1936-7
India . . . . .	381.1	322.6	337.9	319.5	305.1
Ceylon . . . . .	258.8	197.0	220.2	215.9	206.3
N.E.I. . . . .	186.6	136.2	145.2	146.5	147.8
	826.5	655.8	703.3	681.9	659.2

Quantities in Million Lbs. Year Ending March 31

Non-regulating Countries					
	1932-3	1933-4	1934-5	1935-6	1936-7
China . . . . .	91.4	91.5	102.1	91.0	90.3
Japan . . . . .	27.8	32.9	28.0	37.3	38.0
Formosa . . . . .	14.9	16.6	22.2	20.4	22.0
French Indo-China . . . . .	1.5	1.6	2.8	2.5	3.0
Nyasaland . . . . .	3.0	3.7	5.4	6.7	8.6
Kenya . . . . .	1.1	2.0	2.9	6.0	8.0
Other African Countries . . . . .	.3	.4	.4	.5	1.3
	140.0	148.7	164.7	164.4	172.1
Grand Total . . . . .	966.5	804.5	868.0	846.3	831.3

Clearly, there has been a marked increase in recent years from non-regulating countries, whose competition will have to be reckoned with if regulation is ultimately discontinued.

The following table gives a summary of the absorption of tea throughout the world:

Quantities in Million Lbs. Year Ending March 31

	1932-3	1933-4	1934-5	1935-6	1936-7
United Kingdom*. . . . .	427.2	432.4	436.3	451.0	463.3
Europe (excluding the United Kingdom) . . . . .	114.6	130.8	123.1	128.0	110.0
North and Central America . . . . .	132.3	130.8	110.8	121.4	130.6
South America . . . . .	10.2	8.6	10.1	11.2	11.3
Asia . . . . .	20.2	32.9	41.8	35.5	48.4
Africa . . . . .	62.2	61.4	60.7	65.0	74.0
Oceania . . . . .	59.1	59.7	54.1	50.1	50.2
Producing Countries (Tea not locally produced) . . . . .	14.5	9.8	8.1	9.4	8.6
Total . . . . .	849.3	866.4	845.0	877.6	902.4

\*Largest tea consumer *per capita* in the world.

**Technical Training:** see VOCATIONAL EDUCATION.

**Technicolour:** see PHOTOGRAPHY.

**Telegraphy.** The year 1937 was characterized by the development and practical application of previously known principles rather than by the introduction of epochal inventions.

**Automatic Tie-Line Switching.**—This device provides a means whereby any one of a number of customers equipped with teleprinters may automatically transmit telegrams direct to the central telegraph office over one of a number of trunks. This arrangement is useful where the expense of direct lines from central office to each customer would be prohibitive.

**Carrier Systems.**—This method of securing a number of telegraph channels from a few line wires by means of electric currents of different frequencies has been improved to permit a further increase of the number of channels which may be secured from a given number of line wires.

**Facsimile Transmission.**—Facsimile transmission was given a new impetus by the successful application of a simplified method of reproduction. Gradations of scanning light reflected from original copy carried upon a revolving drum are transmitted as electrical impulses. At the receiving end these signals are amplified and applied through a stylus to mark electro-sensitive dry recording paper moving upon the drum of a synchronized receiving machine. The received copy requires no processing and is ready for immediate delivery.

**Message Conveyors.**—One of the methods by which messages are conveyed from point to point in large telegraph offices is by means of moving belts. Improvements in belt design have made it possible to increase their maximum speed from 500 to 1,000 ft. per minute.

**Ocean Cables.**—Improved vacuum tube amplifiers, measuring and balancing devices, repeaters, increased voltages, etc., have improved and stabilized operating conditions and afforded more efficient use of ocean cables. The use of direct multiplex channel

circuits, operated by printer, between important cities on both sides of the Atlantic has increased.

**Power Plants.**—Mercury vapour tubes are utilized to provide rectifier units replacing expensive dynamo plants. Portable emergency power plants, consisting of a gas engine coupled to a generator, have undergone steady improvement.

**Press Services.**—An important development in connection with telegraphic facilities furnished to press associations has been the establishing of circuits usually beginning and terminating at the headquarters of the association and serving a number of newspapers in distant cities. One of the important features of this type of circuit is that it permits any newspaper on the circuit which has transmitting facilities to cut the circuit at that point and send two separate stories simultaneously to all other stations.

**Reperforator Switching.**—Telegrams are relayed between printing telegraph circuits expeditiously and economically by a system of reperforators and intra-office circuits which require but one simple switchboard operation to replace manual reception, distribution and re-transmission.

**The Varioplex.**—This device makes it possible for a group of subscribers economically to share the full transmission capacity of a group of telegraphic circuits which is available to all and which is fully and equally shared among subscribers working directly with each other at any instant. This affords a most efficient use of trunk wire capacity.

(N. C.)

**Telepathy:** see PSYCHICAL RESEARCH.

**Telephone.** Many technical advances in the last eight years have led to the attainment of higher standards of telephone service. Notable among them are important improvements in the design of the telephone transmitter and receiver and other subscriber apparatus, and improvements and extensions in

COAXIAL CABLE being drawn into conduit

NEW YORK-PHILADELPHIA COAXIAL CABLE

the line and radio facilities for long distance communication. The use of dial telephone equipment in central offices has also been carried in most countries well beyond the point at which it stood in 1929. The present article will, in so far as is possible in a few words, bring up to date the information of that year.

The most spectacular telephonic advance, in that it has broken new ground, is to be found in the numerous overseas radio channels which are now operating on an international basis. The first of such channels was that between the United States and England. It is of the so-called long-wave type (eastbound frequency is 60 kilocycles and westbound 68 kilocycles) and was opened for service in 1927. Since then it has been supplemented by three short-wave channels. This group of circuits is the largest and perhaps the most important single overseas group. But the demand for international telephony has grown so rapidly that within the decade more than one hundred and seventy-five overseas radio telephone circuits for the handling of public message business have been created, and cover the earth as a very substantial yet invisible network.

Today 98% of the world's telephones are interconnected. Behind this rapid advance in international telephony stand, of course, important developments in the instrumentalities of radio communication. Notable among these may be mentioned water-cooled vacuum tubes of large power, greatly improved antennas, and improved auxiliary devices for the more effective overcoming of the interference which is inevitably associated with radio transmission.

Paralleling these overseas extensions which have been made possible by the radio telephone, additions of very fundamental importance have been made to the long distance land lines, both in the United States and in Europe. Wherever possible these addi-

tions have taken the form of lead-covered cable, each cable containing several hundred distinct circuits. The advantages of the cable circuits as compared with open wire lines arise particularly from their increased electrical stability and freedom from failure because of storms, and hence increased reliability in service. By virtue of this important characteristic, the toll cable network of backbone circuits has contributed significantly to the maintaining and extending of a very rapid long distance service.

In spite of the fact that the usual toll cable carries as many as two hundred to four hundred individual lines, the problem of multiplexing these lines by the "carrier" principle has assumed economic importance in view of what we envisage as the future needs. The development of a very successful twelve-channel system has been effected and so far as the United States is concerned numerous installations are under way. As an additional instrumentality for providing more abundant long distance circuits in the future, the so-called coaxial cable is now in its trial stages. In brief, it also operates on the multiplex or carrier principle, enabling two pairs of conductors (each pair consisting of a wire surrounded by a concentric pipe and transmitting in one direction only) to provide between two hundred and five hundred telephone channels, depending upon the range of the filters and the amplifying devices, or repeaters, with which the cable is equipped. This type of cable will also be used for the transmission of television programs whenever such a demand arises. It will be appreciated, of course, that in the case of the coaxial cable, by far the major portion of the development work has necessarily centred on the amplifying and filtering (or band-splitting) devices which are needed. The transmission loss of the cable is such that the message currents must be re-amplified every five to ten miles, while the filters used to separate the hundreds of messages from one another without extravagant waste of the frequency bands separating the channels represent the practicable limits of present-day refinement.

A very significant research program of the decade just passed is that which has culminated in fundamental improvements in the basic instruments of telephony, the carbon transmitter and the receiver. These improvements are available in the United States in all models of subscribers' sets; they can be applied as readily to the combined hand set as to the older wall and desk types. These developments yield superior results, partly because of better quality and partly because they make possible a higher level of transmission. Although not directly connected with improvement

AN ARTIST'S VISUALIZATION of the world's largest reflective telescope on Mt. Palomar

in the transmitter and receiver, it should be noted that the anti-sidetone type of subscriber's set has been accorded almost universal adoption within recent years.

The transformation of central office equipment from the manually operated to the dial operated type has proceeded steadily both in the United States and abroad. As yet, no outstanding changes in the equipment have been described. An important new system known as the cross-bar system has, however, been completed and will shortly be available for detailed discussion.

From the subscriber's point of view, the net result of the improvements just cited—and all of them are of a major character—has been a steadily bettered service when considered from such dominant standpoints as cost, speed of service, and interruptions or failures due to equipment faults. The variety of services offered has also grown. Thus, by the recently inaugurated

conference call, persons numbering up to ten or twelve and scattered hundreds of miles apart can be assembled telephonically in a few minutes' time, and can carry on a discussion as though seated around a table.

(W. S. G.)

**Telescopes.** Of the large telescopes planned for use at observatories throughout the world the following are in course of construction:

**200-inch Reflecting Telescope (F 3.3)** of the California Institute of Technology. Designed in co-operation with the Mount Wilson observatory of the Carnegie Institution of Washington. Located on Palomar mountain in Southern California where the steel dome 135ft. in diameter is under erection. The front surface of the 200-inch disc has been ground to nearly the required depth and the telescope tube 60ft. long and 22ft. in diameter is com-

**TUBE 60 FEET LONG** for the world's largest telescope, the 200-inch reflector being erected at Mt. Palomar, California. It will bring the moon in effect within 24 miles of the earth

pleted. Work is well advanced upon the mounting, including the massive crescent-shaped frame which will provide the main bearing for the telescope through a system of oil films maintained under high pressure. A complete model of the telescope (scale 1:10) with optical parts has been built and tested.

**82-inch reflecting telescope (F 4)** of the McDonald observatory of the University of Texas in co-operation with the Yerkes observatory of the University of Chicago. Located on Mount Locke in Western Texas. Buildings, mounting, and several auxiliary instruments completed but optical work still in progress.

**74-inch reflecting telescope (F 4.9)** of the Radcliffe observatory, Oxford. To be located at Pretoria, Union of South Africa. Mirror disc recently cast and mounting under construction. Auxiliary instruments under design.

**21-inch twin photographic refracting telescope (F 7)** of the Lick observatory of the University of California. To be located on Mount Hamilton, California. Optical figuring of the lenses commenced and mounting under construction.

The most important development of the year has been the growing use of the type of telescope first designed by Bernhard Schmidt of Germany, and its adaptation for use in spectrographic cameras. It consists of a concave spherical mirror with a thin glass plate placed in the incident beam of light specially figured to correct the aberration. Aperture ratios as high as  $F 1$  may be obtained in this way and the combination gives very high photographic efficiency. With the use of plates or films curved to the focal radius a field of  $10^\circ$  or more may be obtained in excellent definition. Two such telescopes, one with an aperture of 44cm., at Bergedorf, Germany, and one with an aperture of 18 inches on Palomar mountain, California, are in regular use. A considerably larger instrument is under consideration for the Palomar Moun-

tain observatory as an adjunct to the 200-inch telescope.

(W. S. Ap.)

**Television.** From about 1926 onwards, experimental transmissions of what is usually termed "low definition" television were carried out in several countries. The standards used varied between 30 and 120 lines per picture, with a frame frequency as low as  $12\frac{1}{2}$  per second in some cases. Such transmissions have never been developed successfully on a commercial basis, but they resulted in attention being paid to higher standards of definition, progressing in stages from 120 lines up to some 400 or more.

At the beginning of 1937, the only practical use to which television had been put was for a public broadcast service in London using a high standard of definition. Experimental broadcast services, also using high standards of definition, were in operation in several countries, notably the United States, Germany, and France, to which further reference will be made.

**United States.**—In the United States, an experimental service, not intended for general public reception, was operated by the National Broadcasting Company during the latter part of 1937. A large number of receivers were distributed to interested persons for observation purposes. The transmitter aerial was situated on the Empire State building, which is approximately 1,250ft. high, while the studio was situated in the National Broadcasting Company's headquarters in Radio City. Experimental programs were transmitted, using, at first, 343 lines per picture with 30 pictures per second interlaced, giving a repetition frequency of 60 per second; later, the number of lines was increased to 441. The peak power of the vision transmitter was 30 kilowatts. The system used for the pick-up depended on an electron camera device developed by the Radio Corporation of America, differing somewhat from that used in England. A frequency of 49.75 megacycles per second (6.03 metres) was used for transmitting vision and 52.0 megacycles per second (5.77 metres) for the accompanying sound.

The signals, although basically similar in form to those used in England, differed particularly in that their polarity was

**LOOKING DOWN THE TUBE** of the second largest telescope in 1937 prior to its shipment to Pretoria for the Radcliffe Observatory there. It has been constructed at the optical works at Walkergate-on-Tyne

FOUR PORTRAITS showing technical progress in television transmission from 1929 to 1931 and to 1934 and 1937

reversed. That is to say, in the case of the American method, the synchronizing impulses raised the transmitter output to a maximum, while in the English case they reduced it to zero. The sense of the vision signals representing tonal gradations from black to white was also similarly reversed.

The studio was connected to the main transmitter by a special cable as well as by an ultra-short wave link transmitter. Towards the end of the year, the National Broadcasting Company acquired mobile equipment for transmitting events not occurring in the studio. Also towards the end of the year the Columbia Broadcasting System of America announced the construction of a television station in New York, the aerial of which was to be mounted on the summit of the Chrysler building. It was stated that the peak power of the vision transmitter would be 30kw., and that the station would be ready for operation during 1938.

**Great Britain.**—In England, the broadcast television service was opened by the British Broadcasting Corporation on Nov. 2, 1936, and at the same time suitable receivers were made available for purchase by the public. The station was situated at the Alexandra Palace in the London area, approximately 5mi. north of Charing Cross, and some 300ft. above sea level. The normal range was about 30mi. although reception in certain directions up to 100mi. or more has been recorded.

At the London television station a duplicate plant was installed, following two distinct systems, which at first were used during alternate weeks. One system, developed by the Marconi—E.M.I.

Television Company, employed interlaced scanning with 405 lines giving 25 complete pictures per second. According to this system, the number of frames per second is 50, each frame consisting of  $202\frac{1}{2}$  lines, the lines of successive frames being interlaced. Thus the effective number of repetitions, from the point of view of picture steadiness, was 50 per second, while the amount of detail transmitted corresponded to 405 lines, the equivalent modulation band width being only one-half that necessary to transmit 405 lines per picture for 50 pictures per second sequential scanning. The method used for transmitting both living subjects and cinematograph film depended on an electron tube device, based fundamentally on a suggestion by Campbell Swinton in a letter to *Nature* in 1908, and given practical effect in an American device known as the "Iconoscope." The tubes used in England were developed and manufactured by the research department of the Marconi—E.M.I. Television Company in London, and bear the trade name of "Emitron." They contain a screen measuring about 5in. by 4in. (12.7cm. by 10.2cm.), consisting of a mosaic of minute light sensitive cells on to which an image of the scene to be televised is focused by an optical system similar to that used in an ordinary photographic camera. The screen is scanned by a fine electron beam, which has the effect of setting up currents corresponding to the amount of light falling on each element forming the mosaic. The currents derived from the electron tube are transmitted, together with electric pulses to provide the necessary synchronization between the transmitting apparatus and the receivers. The apparatus

will operate satisfactorily either in natural or artificial light, the technique used in the television studio being somewhat similar to that in a film studio. The apparatus for reproducing the sound is similar to that used for ordinary broadcasting.

The second system, used as stated during alternate weeks, was developed by the Baird Television Company, and produced a 240-line picture with 25 pictures per second, sequentially scanned. The frame frequency in this case was therefore 25 per second. Scanning was carried out by mechanical devices consisting of an adaptation of scanning discs of the Nipkow type. One method of televising from a studio consisted of photographing the scene on a cinematograph film, with a special process of rapid

THE ICONOSCOPE or eye of the television camera

automatic development, immediately afterwards scanning the film, under water, through the walls of a glass-sided tank. The delay between the instant of photographing the scene and transmitting it was somewhat less than one minute. In the case of this process the sound accompanying the television scene was also recorded on the film and reproduced by the normal method used for an ordinary sound film. The use of this second system for the public service in London was discontinued on Feb. 8, 1937, and the service was continued, using exclusively a standard of 405 lines 50 frames interlaced scanning.

The vision and accompanying sound signals were radiated by two ultra-short wave transmitters feeding two separate aerial arrays mounted, one above the other, on a common 300-ft. steel mast, the vision array being the uppermost.

The wavelengths used for the vision and sound transmitters were 45 megacycles per second (6.67 metres) and 41.5 megacycles per second (7.23 metres) respectively. The peak power of the vision transmitter was 17kw. and the unmodulated carrier power of the sound transmitter 3 kilowatts.

The Marconi-E.M.I. system was further developed during 1937 to enable events to be televised which took place at some considerable distance from the main transmitter. The first notable event of this kind to be televised was the coronation procession in London on May 12, 1937. Others were the International Lawn Tennis matches at Wimbledon, near London, in June, and the Armistice Day ceremony in London in November. For the latter, an improved form of electron tube was used in the camera allowing distant scenes to be transmitted effectively.

Two alternative methods have been employed for connecting the television apparatus to the main vision transmitter at Alexandra Palace. One consisted of a specially designed underground cable, with two air-spaced conductors capable of passing the wide band of frequencies (about two and a half megacycles per second) necessary for obtaining the required degree of picture definition. The other method, used for events where a cable connection was not possible for economic reasons, involved the use of a low-power mobile television transmitting unit operating on a wavelength of 64 megacycles per second (4.69 metres) in conjunction with a radio receiver installed in the same building as the main vision transmitter.

During the year, some 15 firms placed receivers on the market in London, the average size of the reproduced picture being approximately 8in. by 10in. (20.32cm. by 25.4cm.).

**Germany.**—In Germany experimental transmissions have been carried out for some years from the Funkturm at Witzleben, using 180 lines and 25 frames per second. Vision was transmitted on 44.3 megacycles per second (6.77 metres) and sound on 42.5 megacycles per second (7.06 metres). Receivers were not on sale to the public, but demonstrations were given at a series of viewing rooms in various parts of Berlin. Experimental work was carried out during the year by the German postoffice and several private firms on systems with a higher standard of definition. It has been announced that a new standard of 441 lines, with a frame frequency of 50 per second, interlaced, has now been adopted, and that further transmitters are being built to be in operation in 1938. One of these was to be situated on the summit of the Brocken, the second on the Feldberg in the Taunus mountains, and the third in the Rhineland.

**France.**—In France transmissions have been made for some time past from the Eiffel Tower, with both 60 and 180 lines and 25 frames per second. Unlike the practice in other countries, the accompanying sound has been radiated on the ordinary broadcasting wave of 1,456 kilocycles per second (206.0 metres). During 1937, a new high definition transmitter, having a peak power of 30kw., was installed in the Eiffel Tower station. This uses 455

## TEMPELHOF AIRPORT—TENNESSEE

lines, 50 frames per second interlaced, giving 25 complete pictures per second. This transmitter uses a frequency of 46 megacycles per second (6.52 metres), and in this case the accompanying sound is also transmitted on an ultra-short wave, namely, 42 megacycles per second (7.14 metres). During the Paris Exposition of 1937, high definition demonstrations were given, using electron camera apparatus.

During 1937, the possibility of developing television using a large screen, suitable for cinemas and theatres, was under consideration, and several firms were working on apparatus with this object in view. (See also BROADCASTING; ELECTRICAL ENGINEERING; RADIO, SCIENTIFIC DEVELOPMENTS OF.)

(N. As.)

**Tempelhof Airport:** see AIRPORTS; BERLIN.

**Tennessee,** the sixteenth State to enter the Union, popularly known as the "Volunteer State"; State flower, iris; State bird, mocking-bird; area, 42,022 sq.mi.; population according to the U.S. Census of 1930, 2,616,556; estimated July 1, 1937, 2,893,000. Capital, Nashville, 153,866. The only city with larger population is Memphis with 253,143. Of the

GORDON BROWNING, governor of Tennessee

State's population, 896,538 or 34.3% are urban; 2,138,619, whites; 477,646, coloured; 2,125,553 native-born white; 13,066 foreign-born white.

Tennessee's constitution was last revised in 1870. The Legislature in 1937 adopted the county unit plan of voting. Returns at the last presidential election were: Democratic 322,083; Republican 146,516; Socialist 685; Prohibition 632; Communist 326; Union 296. Governor, Gordon Browning; secretary of State, A. B. Broadbent; attorney-general, Roy Beeler; commissioners as follows: administration, Wallace Edwards; agriculture, John Goodman; conservation, Samuel Brewster; education, W. A. Bass; finance and taxation, Jordan Stokes, Jr.; highways and public works, M. O. Allen; institutions and public welfare, George Cate; insurance and banking, James McCormack; labour, Albert Gore; Public Health, W. C. Williams; and railways and public utilities, Peck Turner, Leon Jourolman, and Porter Dunlap.

**Education.**—Per cent of illiteracy in 1930 for whites was 5.4, for coloured 14.9. Of 6,134 elementary schools 1,465 had 3 or more teachers. One-teacher schools declined from 3,555 in 1927 to 2,887 in 1935. Enrolment in elementary schools was 567,157. In 1935 all but 8.5% of elementary teachers had more than high school training; 17.8% were college graduates. The State maintains seven institutions for higher learning with an enrolment of 10,800 students in 1934-35, and an estimated valuation of \$15,050,001. In addition there are separate schools for the blind, the deaf, and underprivileged children; three State hospitals for the insane; a home and training school for feeble-minded; and four training or correctional schools, namely for white boys, coloured boys, white girls, and coloured girls; a commission and workshop for the blind; and two State penitentiaries.

**Finance.**—In 1936 there were 72 national and 253 State banks, with resources of \$378,622,000 and \$128,306,000 respectively. Savings deposits averaged \$45 per capita, the State ranking 4th in

the South. Building and loan associations numbered 57, had 23,061 members, and assets of \$17,574,000. Insurance payments made by policyholders amounted to \$56,200,000 in 1935. In 1934 there were 505 companies licensed to write insurance in the State.

**Agriculture.**—There were 273,783 farms in 1935; 1,308,420 farm population; 19,085,837 acres in farms with 6,134,200 acres of crop land harvested. Estimated value of crop production was \$139,698,000 in 1936. Corn, 2,858,000 acres, 57,160,000 bushels; cotton, 810,000 acres, 431,000 bales; hay, 1,562,000 acres, 1,068,000 short tons; tobacco, 95,400 acres, 76,098,000 pounds. Cattle on farms Jan. 1, 1937, were 1,148,000; hogs, 992,000; horses and mules, 442,000. Cash farm income was \$137,104,000 in 1937. Tuberculin testing of all cattle in the State was completed in 1935. Commercial forest area in 1929 was 14,000,000 acres. The cut in 1935 was 337,008,000 board feet, total value of lumber products \$11,944,159, of which \$6,831,597 were added by manufacture.

**Manufactures.**—In 1935 there were 2,011 manufacturing plants yielding products valued at \$531,338,490, of which \$226,556,901 constituted value added by manufacture. Value of mineral production was \$25,743,471 in 1935. Bituminous coal production in 1936 was 5,070,000 short tons; phosphate rock 644,000 long tons. Value of phosphate rock produced was \$2,598,279 in 1936. Manufacturing and urbanization are making marked progress in the State.

The Great Smoky Mountain National Park with 174,230 acres in Tennessee attracted 727,243 visitors for the year ending Sept. 30, 1937. Cherokee National Forest, adjacent to the park, comprises over 505,000 acres.

(C. E. A.)

**Tennessee Valley Authority.** Created by an act of Congress in 1933 as a corporation to provide for the unified development of a great watershed area in order to make full use of all the resources of that area, the Tennessee Valley Authority has been conducting an experiment unique in the history of government planning and operation. The area involved in this experiment, 40,000 sq.mi., is roughly equivalent of that of England; the engineering problems involved in the development of the water resources of the rivers are the equivalent in financial value to that of the Panama canal. Although there have been a few instances of multipurpose projects, such as Boulder dam, never before has there been an attempt to plan and develop the resources of an entire river system for the maximum benefit of the entire region with respect to all purposes.

While it is still far too early for the success of the experiment to be definitely determined, a measure of the value of this development can be made by observing the progress in the fourth year of its existence. In 1937 two large dams—the Norris dam, a storage dam on one of the tributaries, and Wheeler dam on the main river—were completed and put into operation, while construction was materially advanced on four other dams, three of them—Pickwick Landing, Gunterville, and Chickamauga—on the main river and the fourth, Hiwassee, on another tributary. In addition plans were developed for Gilbertsville dam, the largest and nearest to the mouth of the river. Expenditures for these projects during the year totalled \$33,000,000.

Flood control is perhaps the most impressive element of the plans at the present stage; the Gilbertsville reservoir, for instance will have a storage capacity of 4,600,000 acre-feet for flood control alone and will reduce flood flows on the lower Ohio and Mississippi rivers by 200,000 cu.ft. per second thus materially aiding the flood protection works on the Mississippi river. The size of this reservoir and its effect for flood control is unprecedented. Its total cost will be in the neighbourhood of \$100,000,000. As all other Authority dams, this will be a multipurpose dam, serv-

ing the interests of navigation and power development as well as flood control. A demonstration of the value of the system for flood control was given during the great winter flood of 1937 when the Norris and Wheeler dams alone operated for flood control reduced the flow in the Ohio and Mississippi rivers by 32,000 cu.ft. per second and materially assisted in saving Cairo from flooding.

The value of navigation, of course, cannot accrue until a navigable depth is obtained for some important stretch of the river. While this cannot be accomplished for some years, already there have been many indications that once navigable depths are obtained industries will avail themselves of the more economical water transportation.

The creation of water power incident to the construction of the dams is a third purpose of importance. The two dams completed in 1937, together with the existing Wilson dam taken over by the Authority, provide an electrical capacity of 350,000 kw. with a firm power capacity of 260,000 kw. Many contracts have been made for the sale of this energy to municipalities, co-operatives, and some private industries at rates generally lower than those prevailing in this region. Numerous injunctions and litigation brought by the power companies have been dissolved by decisions favourable to the Authority, clearing the way for further expansion and sale of surplus power. That the program has not been detrimental to private interests is demonstrated by the fact that the three large private utilities in this region have increased their domestic consumption of electricity from 1933 to 1937 by from 44 to 92% as compared with the average rise for the nation of 20%. The Authority has also promoted greatly the rural electrification of the area, and, through experimentation, has developed additional uses for electricity such as hay drying equipment and freezing equipment for agricultural products.

Another important activity of the Authority has been the development of phosphate fertilizer in connection with the use of the electric furnace. Phosphate fertilizers of higher concentration have been developed, including a metaphosphate containing from 60 to 70% of plant food. This development, enabling the utilization of low grade phosphate deposits in the Western States, will have a permanent value with respect to conservation of this important element in soil economy. Linked with the fertilizer program has been soil conservation, including the encouragement of diversification in agriculture, terracing of hillsides, encouragement of animal husbandry, and the reforestation of denuded areas.

Other developmental work has been the investigation of the mineral resources of the area, the development of native kaolins for use in high grade pottery in connection with the electrical furnace, and the encouragement of co-operatives for collecting, grading, and marketing agricultural products. The encouragement of recreational areas, for which the lakes created by the construction of the dams are a contributing factor, is also an important activity. Since the completion of the Norris dam, in this reservoir alone—a lake with a shore line equal to that of Lake Michigan—more than 500 water craft have been put into operation.

In all of this activity the Authority has co-operated with numerous Federal agencies, seven State governments, and hundreds of local and county governments: an unprecedented experiment in co-operation, the success of which is not yet entirely demonstrated but which is well on its way toward fruition.

(A. E. M.)

**Tennis:** see LAWN TENNIS.

**Terauchi, Juichi** (1879— ), minister of war in Japan, was graduated from the Military Staff college in 1900. He was successively chief of the general staff of the Chosen army, commander of the 4th and 5th

divisions, commander of the Taiwan garrison, member of the Military Council, minister of war and chief of Manchurian affairs. General Count Terauchi is one of the five Japanese generals who compose the powerful Military Council. The Council is responsible only to the emperor and is independent of the prime minister and the Japanese cabinet. General Terauchi and his co-members of the Military Council determine the military policies which are today the dominant activities of Japan.

**Termites:** see ENTOMOLOGY.

**Territorial Army.** The territorial army of Great Britain is composed of civilians who volunteer for military training on a four years' engagement with the option of extending it. The normal age-limits are between 18 and 38, but youths of 17 may enlist with the consent of their parents while it has been recently decided that men up to 50 can be taken for home defence in the anti-aircraft units. With the latter exception the members of the territorial army now engage for general service if the force is embodied in time of national emergency, whereas before the war they only undertook an obligation for home defence. The units are administered by county associations, but their training is organized, under the direction of the war office, by the military commands of the areas in which they are situated. The training comprises an annual camp of 15 days' duration and, during the rest of the year, a minimum of 40 obligatory drills in the first year and 20 in subsequent years. Men who cannot manage to attend for the full duration of the camp may come for eight days on condition that they do ten extra drills (a drill is the name given to a period of one hour's instruction at the unit's drill-hall, or headquarters). A bounty of £3 is paid to all who perform these obligations, with an additional shilling for each drill up to 30, beyond the minimum number. At the end of 1937 the strength was just over 160,000 while the establishment had been raised to 200,000—largely to meet the increased needs of anti-aircraft defence.

Since Mr. Hore-Belisha became secretary of State for war in the summer of 1937, a series of measures has been introduced to enhance the status of the territorial army. (See also ARMIES OF THE WORLD.) (B. H. L. H.)

**Texas,** south-central State of the United States and successively a province of New Spain and of Mexico, became an independent republic in 1836 and was admitted to the United States in Dec. 1845. Because its flag under the Republic bore a single star and is still used as the State flag, it is known as "The Lone Star State." Area, 265,896 sq.mi. (largest in the Union); population (U.S. census, 1930) 5,824,715; (estimated, July 1, 1937) 6,172,000. Capital, Austin, estimated population, Aug. 15, 1937, 73,000. The three largest cities, with population estimated Jan. 1, 1937, are: Houston, 366,500, Dallas, 330,000, San Antonio, 301,500. Of the State's population in 1930, 2,389,348, or 41%, were urban; 4,283,491 whites (89,396 foreign born); 854,964 coloured; 686,260 other races (683,681 Mexicans).

**History.**—There were no regular State elections in 1937. Among the chief State officials were: James V. Allred, governor; William McGraw, attorney general; George H. Sheppard, comptroller; Charlie Lockhart, treasurer; Edward

TEXAS: Composition of population

## TERMITES—TEXAS

Clark, secretary of State; Claude D. Teer, chairman board of control; L. A. Woods, superintendent public instruction. The State legislature (Senate, 31 members, the House, 150 members) was in regular session Jan. 12 to May 22, with called sessions convening in May and September. In politics the State is strongly Democratic, but Texas Democrats are divided into liberal and conservative wings. During the legislative sessions there was a sharp contest between the liberals, controlling the House and led by the governor, who demanded higher taxes upon the corporations exploiting the State's mineral resources, and the conservative Senate which preferred a general sales tax. A deadlock resulted and led to some agitation for a one-house legislature. Enlarged appropriations without new taxes increased the deficit in the "general fund" to approximately \$17,000,000; but other funds had surpluses which aggregated about the same amount. Among

JAMES V. ALLRED, governor of Texas

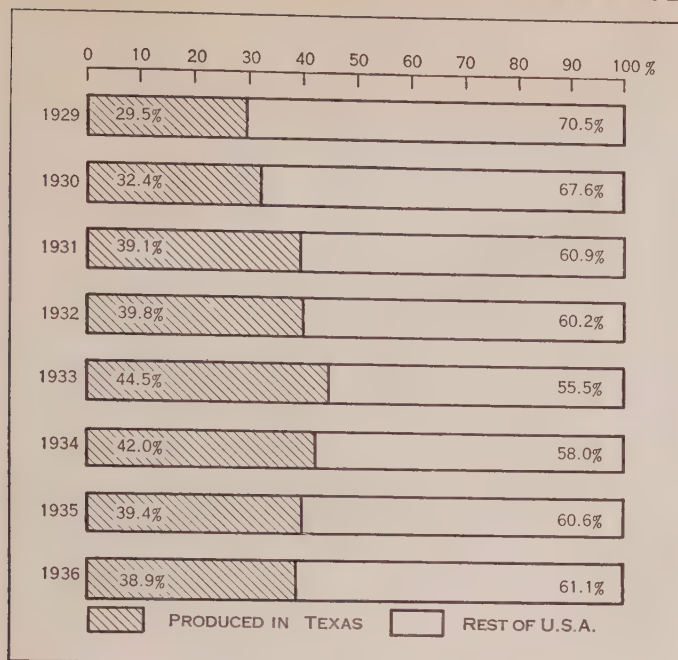

important laws enacted were: giving all cities power to regulate public utilities therein and reducing the legal rate of return on utility investments from 10% to 8%; permitting the commitment of insane without a court trial; setting up a teachers' retirement system, but failing to provide the State's share in financing the system; and repeal of the law permitting betting at race tracks. A constitutional amendment increasing the salaries of State officials, adopted in 1936, went into effect in January; also one providing pensions for indigent persons above 65 years of age.

**Education.**—The public schools, with an enrolment of 1,566,544 children from six to 17 years of age, were supported from both State and local funds. The State's share for 1937-38 was \$39,963,968; the amount from local taxes about \$27,000,000. Of 16 State-supported institutions of higher learning, including one for coloured youths, the largest, the University of Texas at Austin, has about 10,000 students. The biennial appropriations for these institutions for 1937-39 totalled \$14,363,750, exclusive of extension work. In addition to the State colleges there are some 20 denominational and privately endowed senior colleges. There are 209 four-year accredited public high schools.

**Charities and Correction.**—The State maintains ten hospitals and sanatoriums for mental and nervous cases, tuberculosis victims and crippled children; schools for the blind and deaf, both white and coloured; and for delinquent and defective children; two orphans' homes for white and one for coloured; two homes for Confederate veterans and widows of veterans; and a State prison system with extensive farms and shops. Housing facilities at many of the eleemosynary institutions having become inadequate, the legislature in 1937 provided funds for many new buildings. By popular vote a constitutional amendment was adopted, Aug. 23, 1937, authorizing an annual appropriation in aid of the adult blind and dependent children; but the appropriation was not made.

**Banking and Finance.**—Reports of 456 national banks in

PERCENTAGE OF UNITED STATES OUTPUT OF CRUDE PETROLEUM produced in Texas (left end of each bar)

Texas, June 30, 1936, showed a total capital stock of \$81,562,000; deposits, \$1,054,284,000; loans and discounts, \$315,901,000; total assets, \$1,192,845,000. Totals for 1937 are not yet available, but reports of many individual banks indicate a marked increase in all totals. Reports of 417 State banks, June 30, 1937, present the following totals: capital stock, \$17,304,400; deposits, \$154,498,588; loans and discounts, \$63,351,617; total resources, \$206,991,742. For the fiscal year ending Aug. 31, 1937, State revenue receipts were \$154,121,030 and purely government expenditures, \$144,770,274. The tax rate was \$.49 per \$1,000 on a property valuation that had increased from \$3,247,532,305 in 1936 to \$3,323,880,271.

**Agriculture, Minerals and Manufactures.**—At the close of 1937 Texas ranked second among the States in total cash farm income with \$544,176,000 (crop sales \$317,600,000; livestock \$188,350,000; government benefit payments \$38,266,000), an increase of \$82,821,000 over 1936. The total farm income, including products consumed on farms, was much larger, that from crops alone being \$460,983,000. The increase resulted from larger crop yields which more than compensated for lower average prices. The largest single item was cotton, estimated at 5,230,000 bales valued at \$214,430,000; but cottonseed brought \$46,580,000; corn was valued at \$47,552,000; wheat at \$41,690,000; grain sorghums at \$29,308,000; rice at \$8,942,000; truck crops at \$15,967,000, and fruits and nuts at \$15,239,000. Of the total received from livestock about \$48,000,000 came from sales of wool, mohair, and lambs. Especially important was the fact that virtually all parts of the State participated in the increased income and that the panhandle-plains region, formerly plagued by droughts and dust-storms, received some \$85,000,000 from wheat and cotton alone.

The mineral production, chiefly oil, natural gas, and sulphur, was valued at \$787,500,000, an increase of 25% over that for 1936. Texas produces about 40% of the petroleum of the United States and about 75% of the sulphur. The number of producing oil wells rose from 66,000 to 78,000 while 264 new gas wells were brought in.

Complete statistics on the value of manufactured products for 1937 are not yet available, but indexes indicate a total of near \$1,400,000,000, compared with \$1,072,566,428 in 1935. Leading

industries were meat-packing, flour-milling, canning, baking and large scale industries centring about petroleum refining, the manufacture of carbon black from natural gas, cottonseed oil refining and new chemical industries. By far the largest processing industry was oil refining.

Despite the recent general business recession in other parts of the country, business activity in Texas as measured by retail sales and wages paid, was 7% above that of the corresponding period of 1936 and 23% above that for 1935. (C. W. RL.)

**Texas, University of.** President H. Y. Benedict died suddenly on May 10, 1937, at the age of sixty-seven and in the tenth year of his administration. J. W. Calhoun, professor of applied mathematics and comptroller, was appointed president, ad interim, May 30, 1937. The \$2,000,000 Library Extension-Administration building (PWA Project No. 2257) was completed and occupied during the summer. Provision for the University of Texas made by the Forty-fifth Legislature (January-May 1937) provided for (a) partial salary restoration, (b) about forty new positions, (c) a college of fine arts. The enrolment at the main university during the first semester of the long session 1937-38 is 9,380 as compared to 8,488 at the same time a year ago. The full-time teaching faculty of the university, including full-time instructors, is 531 at the main university and 62 at the medical branch. This does not account for administrative officials numbering about 32 people. The entire university staff, including employees of all kinds, numbers 1,295. During the year 1937 (June and August) there were conferred: bachelor degrees of various kinds, 1,292; master's degrees, 288; doctor of philosophy degrees, 32; doctors of medicine, 79. At the medical school at Galveston a hospital for negroes and one for crippled children have been built and equipped at a cost of \$500,000.

(J. W. CA.)

**Textile Industry.** Market prospects turned sharply downwards early in September and continued weak to the end of 1937. Business recession in the United States combined with the Sino-Japanese War and international political unsettlement to reduce commodity prices substantially, destroyed business confidence, and checked demand. On the side of supply, a record crop of American cotton of 18,746,000 bales (of 500lbs.) with carry-over of 6,000,000 bales and a world crop of 51,400,000 bales against a world consumption not expected to reach 31,000,000 bales brought prices at times below 8 cents a pound middling at New York as against 12-13 cents a year before. Acute shortage of wool towards the end of the previous buying season forced prices of all grades to high levels (64s warp tops Bradford 40d. a pound) in January, particularly crossbreds. With a negligible increase of the world clip of about 1%, but reduced demand, new clip prices broke in September-October (64s warp tops 28d.) but recovered (to 31d.) later. A large jute crop of 8,617,000 bales, produced in spite of acreage restriction efforts by the Bengal Government, was offset by abandonment of long-standing restriction of production by the Indian Jute Mills Association in face of competition of new "outside" mills, together with good demand based on prosperity of 1936-37 and large world crops. Jute prices remained firm throughout the year, and industries active, though Dundee made many complaints to the Government against severe and growing competition from Calcutta mills. Flax prices tended upwards throughout the year under the control of the U.S.S.R. monopoly, but mill activity declined towards the end of the year. Hemps have maintained the general level of prices, Italy having almost ceased to supply abroad. The Kenya and Tanganyika sisal crops gave those territories a record return. Spinning, manufacturing, finishing, hosiery, came under the same influences, particu-

larly the weak or uncertain raw material markets. The United Kingdom maintained a strong home market but, as stated, demand declined in the United States.

The British cotton industry is seeking comprehensive statutory powers of compulsion for reorganization. The United States textiles industries have so far largely maintained the "New Deal" working conditions of production and wages. The Australian, New Zealand, and South African Governments have passed Acts for a levy of 6d. per bale for wool publicity and wool research, and an International Wool Secretariat has been formed.

**Fibres.**—Outstanding technically is the further rise in world production of rayon staple fibre, likely to be of the order of 540 million lbs. against 299 millions in 1936. Italy, Germany, and Japan are the leading producers, there being political pressure to become more self-sufficient. The United States output is about 17 million lbs. and the United Kingdom, 29 million pounds. The costs and price have been reduced, Courtaulds "Fibro," 1.5in. staple 1.5 denier, being 10d. a pound against 11d.

The world production of rayon (excluding staple fibre) is expected to have reached about 1,200 million lbs. against 998 million lbs. in 1936, Japan having now exceeded the United States figure of about 320 million pounds. The United Kingdom production was about 120 million lbs. in 1937. Attention continues to be given to refinements of properties. Artificial fibres are being diversified, and "artificial wools" have appeared. The lanital filament or fibre of the Italian concern Snia Viscosa is of casein from skim milk.

Production is estimated at 1,541,000 kilograms, but little or no interest is apparent elsewhere. Germany has provided lanusa, artilana, vistra XT, cuprama staple fibre, and there are many others having crimp, loftiness, dyeing, moisture, or resilience properties imitating wool, but in no case felting. (See also CHEMISTRY, APPLIED; COTTON; LINEN AND FLAX; RAYON; WOOL.)

(H. C. BA.)

**Theatre.** The three major points of interest concerning the American theatre in 1937 were: the renewed evidences of financial prosperity after six years of box-office lassitude, the sudden re-birth of the theatre in the cities outside of New York, and the large remigration from Hollywood of playwrights and actors. The more noteworthy particularized events were the award of the New York Drama Critics' Circle's prize for the best native new play to Maxwell Anderson's commendable blank verse fantasy, *High Tor*, with Paul Green's equally commendable war fantasy, *Johnny Johnson*, and Robert Turney's even more commendable classic Greek paraphrase, *Daughters of Atreus*, voted the runners-up; the award of the Pulitzer prize to Moss Hart's and George S. Kaufman's tenderly humorous but critically negligible comedy, *You Can't Take It With You*; the Dramatists' Guild's bestowal of the Roi Cooper Megrue prize upon Arthur Kober's amiable, if minor, comedy, *Having Wonderful Time*; the outstanding critical and popular success of the English actor Maurice Evans' *King Richard II*; the hubbub caused by George S. Kaufman's, Moss Hart's and Lorenz Hart's lampooning by name in *I'd Rather Be Right* of the officials of the current national government; and the Federal Theatre Project's mild extenuation of and apology for itself in the production of *Dr. Faustus* and the series of news sketches dramatized by Arthur Arent under the title of *Power*, together with the obtrusive incompetence of almost everything else it essayed.

Chief among the year's more unusual theatrical items were the production of four plays by Maxwell Anderson, the simultaneous presentation by eighteen different units of the Federal Theatre Project of the dramatization of Sinclair Lewis' novel *It Can't Happen Here*; the long delayed emergence of the spectacular and

SCENE from the Pulitzer Prize play, *You Can't Take It With You*, by Moss Hart and George S. Kaufman

costly Max Reinhardt-Norman Bel Geddes white elephant, *The Eternal Road*; the increased failure of the once estimable Theatre Guild to live up to its earlier established standards; the enormously augmented audiences on what is known as the road and the great success of the better productions, all clearly indicating the transference to the stage of the considerable antecedent affection for the motion picture; and the numerous productions of the plays of Shakespeare, most of them ill-considered and self-defeated. Aside from the Evans presentation already referred to, only the *Julius Caesar* of the newly founded Mercury theatre had points critically endorsable, and even several of these were open to debate. The *Hamlet* of John Gielgud, ecstatically assimilated by feminine audiences and the more emotional critics, left everything to be desired by sober students of the tragedy, as did the *Hamlet* of Leslie Howard which followed it. The *Othello* of Walter Huston died of spontaneous inanition; the *Cleopatra* of Tallulah Bankhead was unanimously provided with a critical and public asp; and the *As You Like It* of the Surry Players, like the two former exhibits a quick failure, was swallowed up in its own amateurishness.

**The Popular Successes.**—The question of quality not figuring the one way or the other, the biggest popular successes of the year were the Hart-Kaufman *You Can't Take It With You* and *I'd Rather Be Right*, Clare Boothe's derisory comedy of the genus female, *The Women*, S. N. Behrman's adaptation of Jean Giraudoux's saucy paraphrase of the Jupiter legend, *Amphitryon 38*, acted by the Lunts, the already noted Evans' *King Richard II*, Robert Sherwood's adaptation of Jacques Deval's comedy of Russian nobles in exile, *Tovarich*, Mark Reed's comedy of morals, *Yes, My Darling Daughter*, the Murray-Boretz theatrical farce, *Room Service*, Rachel Crothers' comedy of a flutter-minded woman caught in the fancies of Buchmanism, acted by Gertrude Lawrence and called *Susan and God*, Kober's *Having Wonderful Time*, and the Monks-Finklehoffe comedy of undergraduate life at the Virginia Military Institute, *Brother Rat*.

Among the year's phenomena were the continuance of the run of *Tobacco Road*, which opened on December 4, 1933 and which is within hailing distance of equaling and possibly even exceeding the record run of 2,532 performances established by the memorable *Abie's Irish Rose*; the astonishing success in various cities outside of New York of the ancient melodrama, *The Drunkard*,

# THEATRE

which, for a single example, on June 30 entered the fifth year of its engagement in Los Angeles; the unprecedented road success of Helen Hayes in *Victoria Regina*, its box-office returns breaking record after record; the demonstrated distaste of the American public for the psychopathic drama favoured by the English public and the failure of every such imported exhibit; and the concerted effort, at length, of the various managerial and acting organizations to attempt to rid the theatre of some of the barriers that have been standing in the way of its health and greater prosperity. (See also *FEDERAL THEATRE*.) (G. J. N.)

**Great Britain.**—The chief playwright of 1937 in the English theatre was Mr. J. B. Priestley, who, in the autumn of the year, had three new plays running simultaneously in the West End of London. Before the War, Mr. Somerset Maugham was turning out his fashionable light comedies, as richly stuffed with epigrams as a cake with currants. Epigrams, easily made by the practised hand, are no longer in fashion. Mr. Priestley substitutes philosophy for aphorism, and does not fail to attract the modern audience by this severer course.

His three plays, *Time and the Conways*, *I Have Been Here Before*, and *People at Sea*, arrived in that order, both in time and in merit. The first two linked, in terms of vivid, theatrical effect, a philosophy of Time with the lives of people oppressed by circumstance. The idea was to give ground for hope by stressing the fact that Time's seemingly remorseless action may be less real than we think. Mr. Priestley's notions, having much in common with those of such thinkers as Ouspenski and Dunne, need not be challenged here as philosophy: considered as sources of drama, they proved fruitful indeed, yielded two of the best plays of the year, and evoked some of the best acting. Especially notable was Mr. Wilfred Lawson's powerful and poignant performance in *I Have Been Here Before*.

Mr. St. John Ervine returned to the office of dramatist with *Robert's Wife*, which might be called a "problem" play, had not that title tended to disappear. The piece raised issues of social policy in a brusque, challenging way. Our attitudes to peace and war, and more especially to the equality of the sexes when professional interests clash, were matters under vigorous discussion. Miss Edith Evans and Mr. Owen Nares were in excellent form as chief parties to the argument.

A year which took from us Sir James Barrie (*q.v.*) inflicted a severe loss on the stage. It was a pity that Barrie's life, with its many successes, should have ended with a failure. The public did not long support *The Boy David*, the Biblical piece which he

At right, standing, GEORGE M. COHAN, as the president, addresses a meeting of his cabinet in *I'd Rather Be Right*, which lampoons the U.S. National Administration

had written for Miss Elisabeth Bergner. That actress gave a lovely performance of the Jewish leader emerging, still a stripling, from his hungry home. The play was uneven, but had some characteristically charming passages. Probably it would have enjoyed a better run if it had not been so lavishly handled. At a smaller theatre, with a cheaper production and lower running costs, it might have lasted longer.

Another loss was that of Miss Lilian Baylis, the manager of the Old Vic and Sadler's Wells, and a wonderful pioneer of classics for the million. Control of the Old Vic had somewhat passed out of her hands; at least, she was, at the end, entrusting a great deal to Mr. Tyrone Guthrie, a brilliant producer who altered the policy of the Old Vic in some ways and tried to raise its status from that of a good local institution with a respectable resident company to one of international repute. He could command the services of many stars as guest-players, and the greatest were glad to work for him.

Mr. Laurence Olivier's *Hamlet* was perhaps the chief achievement of the year at the Old Vic, and the quality of this production and performance was recognized by the request to repeat them in the courtyard of Elsinore, near Copenhagen. The compliment of this invitation was gladly accepted, and the whole company went out to Denmark to perform *Hamlet's* tragedy on the site of the castle he had known. (The Elsinore castle of today was built long after the original Amleth's day, but was contemporary with Shakespeare's writing of the play.) Despite some unkindly weather, the visit was a great success, and the Danish writers were most cordial in praise of the English troupe. The Danes, being accustomed to rather stiffer and more ceremonial playing of Shakespeare, especially praised the naturalism and fluid, unforced humanity of the English mode of acting.

Mr. Guthrie added to the Old Vic's program by initiating a country festival—at the beginning of September. The chosen town was the Derbyshire Spa of Buxton, and the program though austere, proved very popular, and it is likely that this parallel to the Malvern Festival will continue to be held. The Malvern Festival was not as attractive as usual. Mr. Shaw had nothing new for us, but Sir Cedric Hardwicke appeared therein in a new comedy and gave distinction to the occasion.

A SCENE from the farce, *Room Service*

SONG AND DANCE NUMBER done by chorus girls and members of the Supreme Court in the comedy, *I'd Rather Be Right*

Although Mr. Shaw provided no new play this year, he offered a revised and most Shavian ending of Shakespeare's *Cymbeline*. Shakespeare, who became unusually popular in New York in 1937, was once more much honoured with profitable performance and not as a national hero only. There were splendid audiences all the summer at Stratford, and Mr. Gielgud's production of *Richard II* in London in the autumn was much approved.

Mr. Gielgud's winter program of *Richard II*, *The School for Scandal*, followed by Chekhov's *The Three Sisters*, and *The Merchant of Venice*, showed that private enterprise could render the services which others expect of a National Theatre.

A word should be also said for the splendid season of modern classics given by Mr. Anmer Hall at the Westminster Theatre, culminating in a fine production of Mr. Eugene O'Neill's immense Americo-Hellenic tragedy, *Mourning Becomes Electra*. Here, too, was a worthy substitute for the work of a National Theatre. In this Miss Beatrix Lehmann established once more her claim to be an actress of unusual subtlety and power.

Among the dramatists to succeed in light comedy were Mr. Gerald Savory and Mr. Terence Rattigan, authors of *George and Margaret*, and *French Without Tears*, two successes of the year. Producers to win or confirm their reputes were Mr. Michael Macowan, Mr. Murray Macdonald, and Miss Irene Hentschel. Players who did remarkable work were Mr. Laurence Olivier and Mr. Wilfred Lawson.

(I. Br.)

**Theatre, Federal:** see FEDERAL THEATRE.

**Theosophy.** The American division of the Theosophical Society founded in 1875 by Madame Helena P. Blavatsky and Col. Henry S. Olcott had a membership of 4,351 in 1937. Offices are in Wheaton, Ill. The international Theosophical Society has headquarters at Point Loma, Calif. and there is an independent society of 74 members in New York city.

The Theosophical Society in England has a membership of about 3,500 persons, of whom some 560 are unattached, while 2,940 belong to local lodges and centres. There are 126 lodges and 34 centres grouped into five federations, lodges and federations being self-governing. A Youth Centre is affiliated to the International Federation of Young Theosophists, and meetings are held at the Annie Besant memorial hall, 50 Gloucester Place, Portman Square, London, where are the chief offices for England.

Scotland, Ireland, and Wales each have branches of the society, with groups, lodges, and centres. Within the society in 1937 were 47 national societies or sections in different countries in the world,

## THEATRE, FEDERAL—TIBET

each national society consisting of not fewer than seven lodges. The president of the movement is Dr. George S. Arundale, and its headquarters are at Adyar, Madras, India.

In 1937 an important European convention was held at Copenhagen, and among many international speakers were Dr. Maria Montessori and the Rt. Hon. George Lansbury, M.P. Membership in England in 1937 showed little change from that of the previous year. A legacy of £10,000 was received by the English society.

**Thomson, Elihu** (1853-1937), American electrical engineer and inventor, who had no less than 800 patents issued in his name. During his lifetime he received many awards from scientific institutes and societies in recognition of his contributions to the study of electricity. In addition to his widespread activity in scientific societies, he served as acting president of the Massachusetts Institute of Technology from 1920-22. His death occurred at Swampscott, Mass., March 13, 1937. The reader will find an account of his electrical discoveries and improvements in the *Encyclopædia Britannica*, vol. 22, p. 150.

**Thousand Island Bridge:** see BRIDGES.

**Thwing, Charles Franklin** (1853-1937), president emeritus of Western Reserve University and author on educational subjects, was born at New Sharon, Me., Nov. 9, 1853. After graduating from Harvard and the Andover Theological Seminary, he served as a Congregational minister until offered the presidency of Western Reserve College in 1890. He served in this position during important years of development, resigning only in 1921 to devote his entire time to writing. Though a champion of continued study of the classics, he was known as a liberal. In 1924 he helped to inaugurate the "floating university" which offered courses to students who lived on a liner and toured the world. In the same year, he sponsored resolutions asking political party condemnation of the Ku Klux Klan. He was author of nearly fifty books as well as innumerable articles for newspapers and magazines. He was secretary of the board of trustees of the Carnegie Foundation for the Advancement of Teaching from 1905 to 1921 and in 1922 was president of Phi Beta Kappa of which he became a life senator in 1931. He died in Cleveland, Aug. 29, 1937.

**Tibet**, a country of central Asia, lying N. and N.E. of the Himalayas, mainly a high tableland. Nominally a Chinese dependency, it is in practice independent, under the rule of the Dalai Lama, an incarnation of a Bodhisattva who, on his death, is reborn in a new body which is in due course recognized as that of the new Dalai Lama. The area of Tibet is about 450,000 sq.mi.; estimates of the population vary between 750,000 and 6,000,000; 2,000,000 is probably somewhere near the truth. The capital is Lhasa (pop. perhaps 50,000). The national religion is Lamaism, a development of Mahayana Buddhism. Education is carried on by the many monasteries.

The last Dalai Lama died in 1933, and government has since been in the hands of the Anchin Lama, third in rank in the ecclesiastical hierarchy. On several occasions, last in mid-1937, claims that a new Dalai Lama had been discovered have been made; but so far final recognition does not appear to have been accorded to any of those put forward.

After the Dalai Lama's death, an invitation was extended to the Tashi Lama, second in importance of the priest-rulers, to return to the country from China, where he had been welcomed by the Chinese, who hoped with his aid to re-establish their former influence in Tibet. As, however, he was accompanied by

a detachment of Chinese troops, he was induced to halt in eastern Tibet outside the area ruled from Lhasa, where, in June 1937, the Anchin Lama met him at Hsinking. In November, the Tashi Lama was forbidden to enter Tibet proper until he had performed "10 virtuous deeds," and on Nov. 30 he died, in exile, in China.

Agriculture is not of first importance in Tibet, but some fruit and cereals are grown; sheep and yaks are pastured. The country has become recently the scene of a new interest—the search for the giant panda, a delicate creature indigenous only in this country. Gold and salt are found and worked; manufactures are restricted to articles for local consumption. There are no railways or regular air communications, and roads are primitive. Trade is almost entirely with India and China. There is a Tibetan paper currency, but Indian and Chinese coins are also in use.

**Timber:** see LUMBER.

**Timor Archipelago** consists of Timor, largest of the Lesser Sunda islands, and neighbouring islands roughly midway between Celebes (to the north) and Australia (to the south). Western Timor (5,400 sq.mi.—24,500 sq.mi. with the neighbouring islands) is a Dutch possession; Eastern Timor (7,300 sq.mi.), Portuguese. The population of Dutch Timor (1930) is 1,657,000; of Portuguese Timor, c. 475,000. Coffee, copra, and sandalwood are produced and exported. The islands have become important by virtue of their position on the Europe-Australia air route.

**Tin.** World tin production suffered a depression drop of 53%, from 193,000 long tons in 1929 to 90,000 tons in 1933, with a recovery to 180,000 tons in 1936 against 136,000 tons in 1935. The accompanying table gives the details of output for the leading producers, accounting for 85% of the total.

World Production of Tin  
(Long tons)

	1929	1933	1934	1935	1936
Bolivia . . . . .	43,300	14,700	22,800	25,000	24,100
China . . . . .	6,800	9,500	6,300	9,000	11,300
Dutch E. Indies . .	35,200	12,600	19,400	20,100	31,500
Malaya . . . . .	69,400	24,900	38,200	42,300	66,700
Nigeria . . . . .	10,700	3,800	5,000	6,600	9,500
Siam . . . . .	10,500	10,300	10,200	9,800	12,600
World total . . .	193,000	90,000	121,000	136,000	180,000

While the 1936 total is still 7% below the 1929 high, several of the countries have reached outputs well above their former level; in addition to China and Siam, as shown in the table, other smaller producers not listed in the table that have increased over 1929 are Australia, Belgian Congo, Indo-China, Japan, and Portugal; in most cases these increases are small, but with Belgian Congo and China they are fairly large. The reason why so many countries have surpassed their 1929 output, while the 1936 total is still low, is found in the heavy decrease in Bolivia, which stands at only 56% of the 1929 output.

The United States has no appreciable tin production, but imports about 45% of the world supply for domestic consumption, and in addition supplements the imports with secondary tin, recovered from previous use, to the extent of more than one-third the amount of new metal used. A study of 1936 consumption showed 40% used in tin- and terne-plate; 40% in alloys; 9% in foil, tubes and pipe; 6% in tin compounds; 4% in tinning and galvanizing; and 1% in other uses.

A new technical development is tin-plate on which the tin coating is electro-deposited, with marked reduction in porosity of the coating as compared with hot-dipped plate. (See also COLUMBIUM; METALLURGY.)

(G. A. Ro.)

**Titanium.** Both ilmenite and rutile are utilized as sources of titanium, although the former furnished most of the supply; rutile is probably mined not to exceed 1,000 tons a year, while the figure for ilmenite has grown to something like 200,000 tons. India and Norway are the chief producers, with small amounts from Senegal, Canada, Portugal, Brazil, and Egypt. Although some titanium is used as an alloying agent in steel, the great expansion in demand that has come during the past few years resulted from the development of titanium pigments for paint and ceramic work.

(G. A. Ro.)

**Tobacco.** Consumption of tobacco throughout the world continued to increase during 1937 despite wars which closed half the tobacco factories in China and stopped the customary exports of American tobacco to Spain. The world's leading importer of tobacco, the United Kingdom, retained for home consumption a record supply of tobacco imports, 183,400,000lbs., compared to 175,000,000lbs. in 1936, the previous high. The world's leading exporter of tobacco, the United States, produced 1,505,762,000lbs., which is 30% more than the 1936 crop of 1,154,131,000lbs., the U.S. Department of Agriculture estimated. Ontario, the principal tobacco-growing province of Canada, planted the largest crop in its history, 57,100ac., a 24% increase over the 1936 acreage. Production in Canada in 1937 was 71,352,000lbs., compared to 46,084,000lbs. in 1936, as estimated by the Ministry of Trade and Commerce. Production of tobacco in other countries in 1937 and 1936 was given by the International Institute of Agriculture as follows, the figures in parentheses being for 1936:

Japan, 142,750,000lbs. (142,353,000). Greece, 140,624,000lbs. (178,506,000). Turkey, 138,892,000lbs. (99,208,000). Italy, 94,799,000lbs. (96,783,000). Bulgaria, 69,055,000lbs. (93,098,000). Hungary, 45,751,000lbs. (50,377,000). Southern Rhodesia, 18,560,000lbs. (18,200,000). French Equatorial Africa, 4,400,000lbs. (3,000,000). Estimates of the Chinese crop are around 220,000,000 pounds. No figures for Russia are available. The U.S.S.R. crop in 1936 was estimated at 608,478,000lbs., compared to a five-year (1931-35) average of 354,728,000 pounds.

The 1937 production was marked by a heavy increase in acreage planted to flue-cured tobacco, the type popular for cigarettes, reflecting the continuing larger use of cigarettes both in Europe and America. In the United States the consumption of cigarettes has increased by about 10% each year since 1932, and the consumption of cigars about 6% each year since 1933, the U.S. Department of Agriculture estimates. The flue-cured tobacco crop in the United States was the second largest on record, 850,230,000lbs., or 25% larger than the 1936 crop of 682,850,000 pounds. The record crop of this type of tobacco was 865,171,000lbs. in 1930. In Canada the increased acreage in flue-cured tobacco was about 37%, while 23% less of burley was planted and the dark tobacco acreage was also reduced. In Japan, China, Manchoukuo and Chosen governments are encouraging the growing of flue-cured tobaccos over other types.

Much of the increase of tobacco in the tobacco-growing countries of the British Empire is attributable to the imperial preference tariff on tobacco imported into the United Kingdom. Since 1919, when 60 years of non-preferential rates and free trade were suspended, imports from Empire tobacco countries to the United Kingdom have increased progressively almost every year, and the acreage in Canada, Southern Rhodesia, India and Nyasaland has likewise increased. The United Kingdom's import duty on leaf tobacco from the United States and other foreign countries is the equivalent of \$2.35 to \$2.61 a pound. The duty on Empire leaf is 51¢ a pound less. Of the tobacco supply the United Kingdom annually retains for home consumption only 1.01% was

imported from Empire countries in 1919. In 1937, when the amount of tobacco retained in the United Kingdom was the record supply of 183,400,000lbs., 23.6%, or 43,280,000lbs., were imported from countries of the Empire.

Tobacco exports from Cuba for the period of January 1 to September 30 in 1937 and in 1936 are given by the Cuban government as follows, figures in parentheses being for 1936: Leaf tobacco, 9,305,264 kilograms (7,906,306); cigars, 27,393,102 in number (33,482,252); cigarettes, 17,164,211 (17,678,494); pipe tobacco, 14,609,000 kilograms (34,800,000).

For fuller discussion of British preferential tariffs see "British Imperial Preference in Relation to United States Leaf Tobacco Exports" in *Foreign Agriculture*, vol. 1, No. 11, November 1937, published by the U.S. Department of Agriculture. (See also CIGARS AND CIGARETTES.) (S. O. R.)

**Togoland.** This former German colony on the Gulf of Guinea, West Africa, bounded E. by Dahomey and W. by the Gold Coast, is mandated partly to Great Britain and partly to France.

The British mandate marches with the Gold Coast with which it is administered. Area, 13,040 sq.mi.; pop. (1931), 293,670.

The French mandate ("Togo") is the eastern and larger portion, as well as the more valuable. Area, 20,070 sq.mi.; pop. 751,000; capital, Lome (13,340). Imports and exports for 1935 were valued at frs. 31,200,000 and frs. 34,700,000 respectively. The chief products are cocoa, palm kernels and oil, cotton, and copra. There are 206mi. of railway and 2,158mi. of roads.

**Tokyo,** capital of Japan, population (1936) 6,085,800; area 257 sq.mi., situated in 35° 41' N. and 139° 45' E. at the head of the bay of the same name on the south-east coast of Honshu, the main island of Japan. Tokyo is first mentioned in history under the name of Yedo in 1192. For 268 years it was the centre of administration as the headquarters of the Tokugawa Shogunate, although the imperial court remained in Kyoto. In 1869, after the shogunate had given way to the empire, the Emperor Meiji transferred the capital to Yedo, which he renamed Tokyo, or eastern capital. Tokyo suffered (1923) one of the greatest catastrophes of history when an earthquake, accompanied by tidal waves and followed by devastating fires, led to the death and injury of almost 100,000 persons in Tokyo, the neighbouring large port of Yokohama and adjacent towns and villages. Tokyo was approximately half destroyed, Yokohama almost entirely destroyed. Both cities have been rebuilt along much more modern lines. Many large new steel, concrete and brick buildings have been erected in the central business sections of the city, although the old traditional character of the city is preserved in many narrow winding lanes, lined with tiny Japanese houses and shops.

Tokyo took its place among the most populous capitals of the world when it was greatly enlarged by the amalgamation of a large suburban area with the city in Oct. 1932. Twenty new wards were added to the original 15. Tokyo is served by an extensive system of tramcars, buses and city railways. A subway is under construction and the part which has already been completed serves a section of the central districts of the city. It is a self-governing municipality, governed by an elected common council and board of aldermen. A good deal of executive authority is vested in the mayor, who is elected by the common council. As the capital of the empire, Tokyo is the place of residence of a large number of Government officials and civil servants. It is also Japan's largest educational centre, the Kanda Ward being largely a students' quarter. As of March 1, 1935, Tokyo had 22 universities, with 46,625 students and 72 professional schools, with 52,165 students. Tokyo and its environs rank as one of Japan's four

great industrial regions, the others being Osaka, Nagoya and North Kyushu. On Oct. 10, 1936, there were 975 factories employing more than 15 operatives. The number of workers in these factories was 170,830. Features of Tokyo are the many hills on which the city is built and the absence of a regular numbering system for the houses. The city has been selected as the site of the Olympic Games in 1940. (W. H. CH.)

**Tomatoes.** The U.S. tomato crop marketed in 1937 sold for \$27,430,000 for 21,350,000bu. from 198,500ac., the U.S. Department of Agriculture estimates. This compares with \$27,063,000 received for 20,728,000bu. in 1936. The average annual income for the crop (1928-32) was \$25,070,000 for an average production of 17,263,000bu. a year. Yield per acre was 108bu. in 1937 and 113 in 1936, as against a five-year average of 119. Production by States in 1937 was as follows: California, 3,281,000bu.; Texas, 2,844,000bu.; Florida, 2,746,000bu.; New Jersey, 2,100,000bu.; New York, 1,872,000bu.; Mississippi, 912,000bu.; Maryland, 832,000bu.; Tennessee, 770,000bu.; Indiana, 660,000bu.; Colorado, 636,000bu.; Virginia, 608,000bu.; Missouri, 556,000bu.; South Carolina, 488,000bu.; Michigan, 476,000bu.; Pennsylvania, 380,000bu.; Ohio, 373,000bu.; Oregon, 294,000bu.; Kentucky, 276,000bu.; Arkansas, 240,000bu.; Louisiana, 228,000bu.; Washington, 216,000bu.; Georgia, 180,000 bushels. Production in each of the remaining States was under 100,000 bushels. (S. O. R.)

**Tonga Protectorate:** see PACIFIC ISLANDS, BRITISH.  
**Tongking:** see FRENCH INDO-CHINA.

**Tonks, Henry,** F.R.C.S., British artist; born at Solihull, Warwickshire in 1862. Trained in medicine, he abandoned this for an artistic career, and eventually became assistant professor at the Slade school. From 1917 to 1930 he was Slade professor of Fine Arts in the University of London. Tonks exhibited regularly with the New English art club, and his work is to be seen at the Tate gallery, and at Manchester, Melbourne, Capetown, and the Luxemburg. He died at Chelsea, Jan. 8, 1937.

**Toronto,** with a population of 648,309 (1937) and an area of 34 sq.mi. is the second largest city of Canada and capital of the Province of Ontario. Its 2,627 manufacturing establishments produce annually goods to the value of \$360,000,000. Conveniently situated on the line dividing the population of Canada as between East and West, Toronto has become an important centre of distribution of goods to the Province of Ontario, the most populous of the Canadian provinces, and to the rest of the Dominion. In bank clearings, customs revenue and postal revenue, it leads all other cities in the Dominion. There are ten collegiate institutes, four technical schools, four high schools of commerce and 160 public schools besides 39 separate schools and a large number of private educational establishments. The University of Toronto with 7,263 students is said to be the largest university in the British Empire.

The Corporation of the City of Toronto owns the street railway and motor bus transportation, the waterworks system and the local hydro-electric system which has exclusive distribution of electricity for light, heat and power. There are 106 parks and playgrounds with a total area of 2,243 acres. Toronto's imposing harbour is in the hands of a public commission. The Canadian National Exhibition, now in its 60th year, is a great annual fair attracting 1,500,000 visitors. The well-known Royal Winter Fair with its agricultural, live stock and horse show is also held annually. (G. R. G.)

**Totalitarian State,** the name given in recent times to those States having a highly centralized form of government under the control either of a personal dictator who, or of a political group which, refuses recognition of other political parties and denies them any representation or voice in the government.

The leading examples are Fascist Italy and Nazi Germany, though many other countries—including the Free State of Danzig, Poland, Rumania, Estonia, Greece, insurgent Spain, Japan (and in fact if not in name, the U.S.S.R.) in the Old World, and Brazil, Uruguay, and Peru in the New—have either succumbed to or are imbued with the doctrine of "totalitarianism." This is in part derived from Hegel's conception of the Nation-State, from the theory of the State as the supreme expression of all forms of national life to which none of its activities is extraneous; and it may be summed up in Mussolini's formula, "All within the State, nothing outside the State, nothing against the State." General Franco told much the same story in the program that he took over from the Falangists in April 1937, when he proclaimed that the State he was hoping to form in Spain would be a totalitarian instrument in the service of national integrity. The system of political parties with all that flows from them, representation by conflicting parties, and parliament or congress of the well-known type, would, he said, be implacably abolished, and a rigorous discipline would prevent any attempt to poison or disunite Spaniards.

The fallacy underlying the theory of totalitarianism would seem to reside in the fact that a State could be conducted in conformity with its principles only in a world of its own: if "all" is to be "within the State" and "nothing outside the State," the very existence, much less the rights, of other States can receive no recognition. (See also GERMANY: *History*; WARFARE.)

(L. H. D.)

**Touring and Tourist Camps.** The introduction of the modern house trailer has given a decided impetus in the United States to the increase and improvements of camp sites for tourists wherever scenic attractions call. Florida, California, Denver and other parts of Colorado, Niagara Falls, the White mountains of New Hampshire, the Shenandoah valley in Virginia and most all of the National parks of the West, have desirable camp sites for trailers.

Those who wish to travel light and do not care for the more formal hotels can find desirable temporary quarters in the many cabin camp sites. The cabin is a temporary home. Usually there are eating places near by or anyone who wishes may cook his own meals in the cabins. Most States now require that all trailer and cabin camp sites shall have proper sanitation, pure water supply and proper drainage. Bed linen must be changed for each new occupant. In fact, State laws for the protection of the travelling public are now as stringent as to proper regulation of cabin and trailer sites as they are regarding hotels and inns. Almost all of the National parks provide excellent accommodations, where sanitary conditions are excellent.

There is still a growing need for more and better camp sites and those who operate well regulated camp sites get a good year-round business. The increasing demand by trailer tourists for more facilities has led to improvements, so that a good modern camp site often furnishes electricity, water supply, garbage disposal, laundries, wash rooms and toilet arrangements, all as part of the regular equipment, use of which is included in the modest fee for parking the trailer. Fifty cents per night or \$3.50 per week is the usual charge.

Cabin camps, with all facilities, can be had for one dollar per night per person.

(W. A. K.)

**Town and City Planning.** The year 1937 showed a considerable revival of interest and activity in town and city planning matters. This was concurrent with and probably the result of improved economic conditions. Urban building and territorial expansion afford a necessary stimulus for planning progress. Furthermore, in periods of economic depression available public funds are usually required for the immediate services of the moment, rather than for the planned needs of a future day.

For these reasons, there was a general cessation of town and city planning action beginning about 1930. Not only did many communities drop their appropriations for planning work, but many found it necessary to cease appropriations for public improvements already under way. There were, of course, notable exceptions to this general situation to be found primarily in those countries where planned public works under the direction or stimulus of the central Government were used to symbolize a social philosophy. Typical of these were the communities planned and constructed by the Soviet Republic, and the activities of the U.S. Government in connection with the Tennessee Valley Authority and in connection with certain of its housing projects.

The other exception to the general situation of inactivity was where planning projects, usually under the complete or partial control of central governments, were used as a means of providing work relief. It is probable that both the symbolic and relief type of planning will become a more or less permanent fixture in many countries. Under any circumstances it is probable that local authorities will continue to depend more and more upon guidance, if not upon direct aid from superior Governments. If wisely administered, this practice may have desirable results in more intelligent, uniform and valuable work. The danger to the progress in the art of town and city planning lies here, as in all similar situations, in that development may be handicapped by arbitrary and bureaucratic controls.

While local planning activity has shown some revival in 1937, it is by no means equal to that of the late 1920's nor in many ways is it of the same character. The earlier planning was concerned primarily with the amenities of the community. The "city beautiful" and the "garden city" were concepts which oriented much of the planning thought. The best plans were those to be executed by the artist, the architect, or the landscape architect. They were dealing, even in matters of zoning, primarily with a fitting spacial arrangement of the facilities of urban life, or, in other words, with factors which are primarily static. With this school or city and town planning, the goal was a pleasing and orderly arrangement of the essential elements of urban life. Their labours brought much that is worthwhile in modern cities and their guidance will be required in the future.

The coming of the motor car brought many basic changes in urban life, and with it the necessity for a reorientation of planning thought. Safe and convenient facilities for inter-communication between the parts of cities have always been important in urban life. The motor car has vastly increased their importance. The mobility of the average citizen, especially in American cities, has been multiplied many times. Motor equipment has largely taken over the burden of mass transportation and the carriage of commodities. The number of vehicles demanding the use of the public streets has grown enormously. But over and above this, the character of street use has changed radically. Slow moving horse-drawn traffic has been replaced by rapidly moving motor traffic with all of the attendant hazards.

Thus it is that most of the European cities and all of the larger American cities are confronted with the critical dual problems of traffic congestion and traffic accidents. This situation affords a major challenge to city planners, and in the year 1937, with the

full implications of the situation apparent, there is noted a definite shift in planning emphasis. It may be described as a growing emphasis on the dynamics rather than the statics factor of urban life; upon provision for movement rather than placement. This change need cause no concern to those who are interested primarily in aesthetics, for beauty and efficiency in city planning are by no means incompatible.

The year 1937 also showed a definite change in the approach of those planners who are interested primarily in mobility. Until recent years it had been thought that the problems of traffic congestion and traffic accidents could be solved by a widening and rearrangement of existing streets. It is now generally recognized that this was a false hope, and that new routes especially designed for and adjusted to the requirements of automotive traffic must be constructed. The principles of such construction are already established and are commonly set forth under the title "Limited Ways." A limited way is a route for the exclusive use of automotive traffic, provided with a physical separation of opposed streams of traffic, without direct access to abutting property, with a complete separation of all intersections and with a cross section design eliminating friction from vehicles moving in the same direction.

This type of construction is generally illustrated in the German autobahn system and in numerous pieces of urban construction in the United States. The most outstanding example is the west side elevated highway and its northerly extension along the Hudson river in New York city. Portions of the Outer Drive in Chicago also illustrate these principles. Both the cities of Chicago and San Francisco have developed plans for comprehensive systems of limited way construction.

Both theoretically and in actual practice, this type of construction proves its ability to carry large volumes of urban traffic at relatively high speeds and in almost perfect safety. It is anticipated that these routes in the future will carry express bus as well as general traffic and, therefore, will afford an added solution for the urban transportation problem.

The year 1937 has witnessed the completion of a number of very notable traffic improvements in the United States. Among these are the Triborough bridge, the first tube of Lincoln tunnel under the Hudson river, the Henry Hudson and various other parkways, all in New York city; the outer bridge over the mouth of the Chicago river and certain new portions of the Outer Drive; and in San Francisco the dedication of both the Golden Gate and the San Francisco-Oakland Bay bridges, each the largest of its kind in the world. (See also HOUSING.) (M. McC.)

**Townsend Plan,** initiated during the depression and named after its originator, Dr. Francis E. Townsend of Long Beach, Calif. (born Fairbury, Ill., 1857), provided an old age pension of \$200 a month for all persons arriving at the age of 60 who retire from active employment. According to the terms of the Old Age Revolving Pension, the money had to be spent within the month. The number of pensioners would be approximately 10,500,000 and the annual cost of the plan, on this basis, would work out at \$25,200,000,000, a figure that represents 37% of the national income (\$68,000,000,000) as stated by President Roosevelt in January 1938. According to Dr. Townsend, the pension fund would be financed by a pyramidal tax of 2% on commercial transactions.

But there is nothing in the plan itself to prevent other methods of raising the money required. Amid the economic confusion that followed the closing of banks in 1933, the plan received considerable attention but it was however, subjected in Congress and elsewhere to severe criticism, and by 1937 had dropped out of consideration.

## Track and Field Sports

enjoyed in the United States one of its best years from the standpoint of performances, interest, attendance and numbers engaged. In the National A.A.U. championships, Feb. 27, 1937, three new indoor records were established and seven winners of the previous year successfully defended their titles in a meet which took on an international flavour because of the presence of athletes from Japan, Italy, Hungary and Canada. In the running events Tommy Deckard of the University of Indiana won by racing to a new indoor record for the 3,000-metres steeplechase championship in 8 minutes 48.6 seconds. Norman Bright of the Olympic Club of San Francisco set up another American record when he won the 5,000-metres championship in 14 minutes 45.8 seconds. Two of the stellar performers in the field events were Sam Richardson, of the Achilles Club of Toronto, whose running broad jump of 24 feet 7 $\frac{3}{8}$  inches enabled him to repeat his victory of 1936 and become the only non-American to win a title. In high jumping Edward Burke, of Marquette university, cleared 6 feet 9 $\frac{1}{4}$  inches. During the outdoor National A.A.U. championships, at Marquette University stadium, Milwaukee, July 3, 1937, many of the American athletes at the Olympic Games in Berlin a year previous were turned back by a rush of newcomers. In twenty-one individual titles only one of five Olympic winners attained top honours among the thirty-three competing Olympians; he was John Woodruff, the tall Negro representing the University of Pittsburgh, who showed his heels to a fast field in the 800-metres run, in 1 minute, 50 seconds. Seven other Olympians who had not scored at Berlin came through to victory at Marquette; the performances of the winners of fourteen events were the best ever turned in at a national championship meet, and three of them bettered the existing American records.

To name but a few of the highlights, Jack Weiershauser, Olympic Club, San Francisco, ran 200 metres around a turn in 20.9 seconds, only two-tenths of a second behind Owens' world record; Ray Malott, Olympic Club, raced to victory in the 400-metres event, in 47.1 seconds. Only three other Americans have ever thrown the javelin farther than Bill Reitz, S.C.S.A., who tossed it 224 feet. Jack Patterson, of Rice institute, went over the 400-metres low hurdles in 52.3 seconds.

Among the outstanding track and field achievements in the U.S. in 1937 were: Elroy Robinson, Olympic Club, 880 yards and 800 metres, 1:49.6; Earle Meadows and William Sefton, Southern California, pole vault, 14 feet, 11 inches; Glenn Cunningham, N.Y. Curb Exchange, three-quarters of a mile, 3:00.8, and one and one-half miles, 6:34; Donald Lash, Indiana, two miles (indoors) 8:58; Edward O'Brien, Syracuse university, 500 yards (indoors) 57.6 seconds; George Varoff, Oregon, pole vault (indoors) 14 feet, 4 $\frac{7}{8}$  inches; Edward Burke, Marquette, high jump (indoors) 6 feet, 9 $\frac{1}{4}$  inches; Spec Towns, Georgia, 110-metres and 120-yard high hurdles, 14.1 seconds.

There were forty-one sectional groups of the A.A.U., headed by the Metropolitan, having a total of 1,626 competing organizations in which 50,384 amateur athletes are registered. Other championship events included the junior national and sectional title events, the women's senior track and field championships, the national championships at 15, 20, 25, and 30 kilometres, the marathon and cross-country championships, the national pentathlon championship, the walking championships at 7 miles, 30,000 metres, and 50,000 metres. These events are exclusive of the I.C.A.A.A. track and field championships, indoors and outdoors, the Penn Relays, the Drake Relays, the Pan-American Exposition Games at Dallas, Texas, and the annual Sugar Bowl games at New Orleans, La. Frequent dual track and field meets and triangle meets are held outdoors between the colleges, as well as the annual Prince-

ELROY ROBINSON sets a new, world, half-mile record of 1:49.6 at the second annual World Labor Athletic Festival

ton Track Meet in May which features the headliners in a program of six events. The largest club meets outdoors are the spring and fall games sponsored by the New York Athletic Club at its country home at Travers Island, N. Y.

New records were set up in the I.C.A.A.A. championships by Benjamin Johnson, Columbia, 60-yards dash, 6.3 seconds, and running broad jump, 24 feet,  $\frac{1}{8}$  inch; Edward T. O'Brien, Syracuse, 600 yards, 1 minute, 13.1 seconds; John M. Donovan, Dartmouth, 60-yards high hurdles, 7.5 seconds made in the semi-finals, and won by Donovan in 7.6 seconds; Dimitri N. Zaltz, Boston college, and Daniel Taylor, Columbia, tied for a new championship record in the 16-lb. shot put, 50 feet, 9 $\frac{3}{8}$  inches. The cham-

pionship trophy was won by Columbia with 34 $\frac{5}{14}$  points.

New York's system of track and field training for its public school students probably is unequalled in the world. It is under the direction of the Public Schools Athletic League which organizes championship games for students in its 127 grammar and 34 high schools. In the latter, the times are but a fraction of a second behind college performances; for instance, 50 yards, 6 seconds; 70 yards, 8 seconds; 75 yards, 8.1 seconds; 100 yards, 10.1 seconds, all made indoors.

## World's Best Track and Field Performances of 1937

### 100 Yards

9.6—Robinson, U.S.A.  
9.6—Stoller, U.S.A.  
9.6—Clifford, U.S.A.  
9.6—Collier, U.S.A.  
9.6—Davis, U.S.A.

### 100 Metres

10.4—Walker, U.S.A.  
10.4—Gyenes, Hungary  
10.4—Hornberger, Germany  
10.4—Osendarp, Holland  
10.4—Sweeney, England

### 220 Yards

20.7—Weiershauser, U.S.A.  
20.7—Carter, U.S.A.  
20.7—Mills, U.S.A.  
20.8—Orr, Canada  
20.8—Rodenkirchen, U.S.A.

### 400 Metres and 440 Yards

46.9—Benke, U.S.A.  
47.0—Woodruff, U.S.A.  
47.1—Malott, U.S.A.  
\*47.1—Shore, South Africa  
\*47.1—Young, U.S.A.

### 800 Metres and 880 Yards

1:49.6—Robinson, U.S.A.  
\*1:50.0—Woodruff, U.S.A.  
\*1:50.5—Lanzi, Italy  
\*1:50.7—Borck, U.S.A.  
\*1:50.9—Harbig, Germany

### 1500 Metres

3:50.3—San Romani, U.S.A.  
3:51.0—Wooderson, England  
3:51.2—Beccali, Italy  
3:51.4—Jonsson, Sweden  
3:51.8—Cunningham, U.S.A.

### One Mile

4:06.4—Wooderson, England  
4:07.2—San Romani, U.S.A.  
4:07.2—Lash, U.S.A.  
4:07.4—Cunningham, U.S.A.  
4:08.8—Jonsson, Sweden

### Two Miles

8:56.0—Szabo, Hungary  
8:57.4—Hoeckert, Finland  
9:13.3—Lash, U.S.A.  
9:14.2—Rice, U.S.A.  
9:19.9—Lochner, U.S.A.

### 3,000 Metres

8:15.8—Jonsson, Sweden  
8:17.8—Szabo, Hungary  
8:19.1—Pekuri, Finland  
8:24.5—Maeki, Finland  
8:25.4—Kurki, Finland

### 5,000 Metres

14:28.8—Maeki, Finland  
14:30 —Askola, Finland  
14:31.1—Kurki, Finland  
14:32.4—Salminen, Finland  
14:33.8—Szabo, Hungary

### 10,000 Metres

30:05.5—Salminen, Finland  
30:15.0—Lehtinen, Finland  
30:32.0—Murakoso, Japan  
30:34.2—Askola, Finland  
30:49.3—Tamila, Finland

\*Metres.

### 110-Metres and 120-Yards Hurdles

14.0—Osgood, U.S.A.  
14.1—Towns, U.S.A.  
\*14.2—Staley, U.S.A.  
14.3—Tolmich, U.S.A.  
\*14.3—Sjoestedt, Finland

### 200-Metres and 220-Yards Hurdles

23.2—Weiershauser, U.S.A.  
23.2—Hucker, U.S.A.  
23.3—Vickery, U.S.A.

185.11 $\frac{1}{2}$ —Hein, Germany  
179.3 $\frac{1}{2}$ —Blask, Germany  
179.2 $\frac{1}{2}$ —Folwarshtny, U.S.A.  
178.7 $\frac{3}{10}$ —Lutz, Germany

(J. B. P.)

**Great Britain and Europe.**—The match between the United States and Europe, which was looked forward to as a feature

of the Paris exhibition of 1937, did not mature. Its place was taken by the World Student Championships, which resulted as follows: Germany, 126 points; England, 107½; France, 40; Hungary, 27; Estonia, 26½; Scotland, 26. Had the English and Scottish teams been combined as in previous years, Great Britain would have scored an easy victory. England won all the flat events, with C. B. Holmes, in the sprints, and J. W. L. Alford, in the middle distances, securing double victories. A. G. K. Brown equalled the 400 metres record of 47.8secs., and F. R. Webster, the first British athlete to win a field event at these games, took the pole vault at 12ft. 8½ inches.

At the Inter-University sports, Cambridge defeated Oxford by nine events to two, records being made by A. Irfan (C.) in the shot put, 49ft. 3¼ins., and A. G. K. Brown (C.), 44oyds. in 48.4 secs. Cambridge, scoring 80 points to Oxford's 66 and London's 63, also won the Championship of the British Universities. In the relay races, run on Nov. 27, Oxford beat Cambridge by four events to three. On tour in the U.S.A. and Canada, the combined Oxford and Cambridge team defeated Harvard and Yale and the Canadian teams. Notable features were: A. E. Pennington's sprint double against Harvard and Yale, and his 220-yds. record of 21.3secs.; A. G. K. Brown's 440- and 880-yds. double, with 440-yds. record of 47.7secs.; and C. A. J. Emery's mile in 4mins. 13.8secs. In the match *v.* Princeton and Cornell, Brown and Pennington again produced doubles; Irfan and Kennedy (C.) made new meet records for the shot, 47ft. 7ins., and high jump, 6ft. 3½ins.; while Webster (C.), clearing 13ft., beat the American Intercollegiate champion, Medina, in the pole vault. Perina, Princeton, made a new broad jump record of 24ft. 7½ inches.

A welcome feature of the European year was the many more international obligations accepted by Great Britain. In her two principal fixtures, Great Britain defeated France by 66 points to 54 and Germany by 69 points to 67. In September an under-strength British team toured Scandinavia, and was defeated by Finland, 92 points to 67, and by Norway, 74 points to 65. During this tour, D. O. Finlay (G.B.), equalled the world's 110-metres hurdles record of 14.1 seconds.

Sweden achieved a notable victory over Germany, 107 points to 101, and also beat Hungary. Germany had the distinction, on Aug. 15, of defeating, in separate matches, Belgium, 112 to 74; Denmark, 104 to 76; Czechoslovakia, 129 to 79; Austria, 118 to 77; Poland, 96 to 72; and Switzerland 90 to 68.

A survey of the positions of the European nations shows Denmark to be undistinguished, except for Larsen's pole vault of 13ft. 4 inches. Estonia has two good men in Sule, who has thrown the javelin 233ft., and Kreek, a 51-ft. shot putter. Poland has in Schneider a 13-ft. pole vaulter, and in Gierutto a 51-ft. shot putter, while Kucharski ran 800 metres in 1min. 52.4secs. and 1,500 metres in 3mins. 58.5 seconds.

In Central Europe, Czechoslovakia has made little progress, save for her 172-ft. hammer thrower, Knotek. Austrian athletes are improving, and Proksch, clearing 13ft. 6ins., is the best European pole vaulter of the year. Switzerland's reputation still depends upon Haenni, who beat the American negro, Ben Johnson, at 100 metres in 10.4secs. and 200 metres in 21.3secs. The Hungarians' best man, Szabo, has made a world's 2-miles record of 8mins. 56 seconds. Gynes, the sprinter, and Kelen, who ran 10,000 metres in 31mins. 17secs., are in the top class, while Kovac's 53.4secs. for the 400-metres hurdles was only equalled during 1937 by Hoelling of Germany. Zsuffka pole-vaulted 13ft. 4ins., and Varszegi threw the javelin 231 feet.

Greece won the Balkan Games with 120 points from Rumania 104, Yugoslavia 69, Turkey 26, and Bulgaria 11.

Italy has great athletes in Lanzi, who returned 1min. 50.5secs. for an 800-metres European record, while Beccali covered 1,500

## TRACTORS—TRADE AGREEMENTS

metres in 3mins. 51.2secs., which is about ¼sec. slower than the world's mile record of 4mins. 6.4secs., made by S. C. Wooderson (England). Mariani has 10.4secs. for 100 metres, Caldana 14.8secs. for 110-metres hurdles, while Maffei's long jump of over 25ft. has only been bettered in Europe by Long of Germany. Holland has first-class sprinters in Osendarp and van Beveren, while P. O'Callaghan (Ireland), has thrown the 16-lbs. hammer 198ft. 8.6 inches.

The Finns are as remarkable as ever. Matti Jarvinen threw the javelin 250ft. 10.6ins.; Maeki, returning 14mins. 28.8secs., narrowly beat P. Ward (Great Britain) in the 5,000 metres; and the veteran, Sjoestedt, returned 14.3secs. for the 110-metres hurdles. Germany had three outstanding men in Hein, who made a new national hammer-throwing record of 185ft. 11½ins., Woellke, who made a new British shot-putting record of 52ft. 5ins., and Harbig, who established German records at 400 and 800 metres in 47.6 secs. and 1min. 50.9secs. respectively.

Outstanding performances in Great Britain were the ½-mile records of A. J. Collyer, 1min. 53.1secs., and F. R. Handley, 1min. 52.9secs.; S. C. Wooderson's 1-mile world record, 4mins. 6.4secs.; D. O. Finlay's high hurdles record of 14.5secs.; S. Wilson's javelin record, 194ft. 2ins.; and F. R. Webster's indoor pole vault record, 12ft. 9½ inches. (F. A. M. W.)

**Trade Agreements.** The year 1937 has marked definite progress in carrying forward the American trade agreements program. Of high importance was the announcement on Nov. 18, 1937 of contemplated negotiations between the United States and the United Kingdom. On the following day a similar announcement was made with regard to Canada. Trade agreement negotiations were also initiated during the year with Ecuador, Czechoslovakia, Venezuela and Turkey.

**The Trade Agreements Calendar.**—At the end of the year the Trade Agreements Calendar stood as follows:

*Preliminary Announcement that Negotiations are Contemplated*

Country	Date of Preliminary Announcement	Latest Date for Submitting Suggestions
Venezuela . . . . .	Oct. 26, 1937	Nov. 26, 1937
Turkey . . . . .	Nov. 3, 1937	Dec. 3, 1937
United Kingdom . . . . .	Nov. 18, 1937	Dec. 16, 1937
Canada . . . . .	Nov. 19, 1937	Dec. 17, 1937

*Public Notice of Intention to Negotiate*

Country	Public Notice of Intention to Negotiate Issued	Latest Date for Submitting Written Statements	Date for Oral Presentation of Views
Ecuador . . . . .	April 5, 1937	May 3, 1937	May 17, 1937
Czechoslovakia . . . . .	Aug. 31, 1937	Oct. 11, 1937	Oct. 25, 1937

The year 1937 also marked the passage by the American Congress of a Joint Resolution, approved on March 1, renewing for another three-year period the authority originally conferred upon the president on June 12, 1934, to enter into trade agreements with foreign nations.

The American trade agreements program grew out of the conditions and needs resulting from the world depression following 1929. Nations had entered into feverish competition with each other to sell to foreigners a maximum and to buy from foreigners a minimum of goods. Trade barriers had been built up to unprecedented heights. To constantly mounting tariff walls were added entirely new economic devices for regulating trade—quota restrictions, exchange controls, government trade monopolies, and ex-

port and import licensing requirements. The trade highways of the world became blocked with impassable barriers. International trade fell to a third of its 1929 value. From 1929 to 1933 the value of American foreign trade fell from \$9,640,000,000 to only \$3,125,000,000. The resulting economic and social dislocation was the cause of widespread suffering.

To meet this national emergency, legislation designed to increase American foreign trade was worked out upon the basis of three principles of tariff making, each of which has been separately adopted heretofore in American legislation, but which in combination are entirely new. The three principles are these: (1) Congressional delegation to the president of the power of tariff adjustment within prescribed limits. (2) Tariff negotiation by executive agreement. (3) Generalization of all tariff reductions (except those granted to Cuba) to the products of all countries which do not discriminate against American commerce.

The Trade Agreements Act, signed on June 12, 1934, offers a new program based upon these three accepted principles. The act authorizes the president "for the purpose of expanding foreign markets for the products of the United States" (1) "to enter into foreign trade agreements" and (2) "to proclaim such modifications of existing duties . . . or such additional import restrictions, or such continuance . . . of existing customs or excise treatment of any article covered by foreign trade agreements, as are required or appropriate to carry out" such agreements. The President may not modify existing customs duties beyond 50% nor may he transfer any article between the dutiable and the free lists. The duties thus proclaimed by the president are made applicable to the products of all countries, except that the president may suspend their application to the products of any country "because of its discriminatory treatment of American commerce or because of other acts or policies" which tend to defeat the purposes of the act. The exceptional situation of Cuba is recognized by a provision for an exclusive preferential agreement with Cuba, thus continuing the preferential relationship established by the Commercial Convention of 1902.

The trade agreements program, designed to combat existing world tendencies toward economic nationalism, has a two-fold objective. It seeks, first, the reduction or elimination of excessive trade barriers. Trade barriers such as impede international commerce cause diminished national incomes, depressed standards of living, increased unemployment, financial instability and social unrest. The second objective of the program is the elimination of trade discriminations. Trade discriminations lead to constantly shifting trade currents, commercial uncertainty and insecurity, recriminations and retaliations, trade conflict and war.

The success of the program has been very marked. Since the passage of the act in 1934 16 trade agreements have been made with countries whose trade embraces almost 40% of the total foreign trade of the United States. By means of these agreements trade barriers have been reduced, discriminations eliminated and valuable concessions obtained. The foreign trade of the United States has increased rapidly. Its value in 1937, according to preliminary estimates, was double that of 1933, the year before the trade agreements program was initiated. Whereas the total foreign trade of the United States with non-trade agreement countries increased in 1936 over 1935 by 9.2%, that with trade agreement countries increased by 18.2%. During the first ten months of 1937 (the latest period for which definitive figures are available), while imports into the United States were affected far more by the effects of the severe drought of 1936 and of the industrial recovery than by trade agreements, exports to agreement countries increased by 43.3% over the same period in the preceding year as contrasted with an increase of 31.3% in exports to non-agreement countries.

The effects of the program are world-wide. With the powerful leverage which it affords, the United States has been able to make definite progress in countering the world movement toward arbitrary and discriminatory methods of governmental control over trade and monetary exchange. It is a program which has made and is making for international peace. (F. B. S.)

**British Empire, Europe and Asia.**—A large number of trade pacts were made in 1937. The Reciprocal Trade Agreements program of the United States was advanced only by a single treaty, but the expiry of the minimum period of the Ottawa agreements caused considerable activity in this field in the British Commonwealth; the Oslo group entered into a new understanding; and there were many other trade agreements in Europe and elsewhere.

The United Kingdom-Canada agreement of February stabilized, on the British side, the duty-free entry of many Canadian goods and other privileges maintained under the Ottawa agreement, which it replaced. The United Kingdom lowered the duty on silk stockings and reed organs, and promised not to increase the duty on Canadian motor-cars. Canada lowered the preferential duties on 150 tariff items or sub-items, and conventionalized duty-free entry of other important classes. On a number of articles she guaranteed maximum preferential rates of duty in place of former minimum margins of preference. In September, Canada signed pacts with Australia and New Zealand amending earlier trade agreements; Canadian duties on mutton and lamb and other important products were reduced (*see* TARIFFS). Canada also made fresh arrangements, on most-favoured-nation lines, with Brazil, Uruguay, El Salvador, and France. Under the exchange of notes with France (July), the latter extended her minimum tariff to additional Canadian products and enlarged the quota for Canadian cheese, while Canada renounced certain other quota rights. Negotiations for the amendment of the United Kingdom's Ottawa agreements with India and New Zealand failed of success in 1937, the old arrangements being further prolonged. Australia and South Africa deferred such negotiations until the position between Great Britain and the United States should be clarified. Australia's new most-favoured-nation pacts with Belgium, Czechoslovakia, and France went into force in Jan. 1937. South Africa established most-favoured-nation relations with Czechoslovakia (January) and with Belgium (July). Under a trade agreement with Germany (September), New Zealand reduced intermediate duties on important German products, and abolished primage duty on others; an accompanying payments agreement pledged Germany to employ in purchasing New Zealand goods the whole of the exchange derived from her exports to New Zealand. India renewed and readjusted (April) her convention with Japan, varying her maximum import of Japanese cotton piece-goods in accordance with Japan's purchases of Indian raw cotton. The political separation of Burma necessitated a separate Burmo-Japanese convention (June). The German-Irish Free State treaty, renewed with effect from Jan. 1937, fixed a ratio of three-to-two between Irish import and export trade with Germany. The Free State and the United Kingdom extended their so-called coal-cattle pact in January, the latter removing the special duties on Irish horses, the former those on sugar and subsidiary products. The United Kingdom signed a most-favoured-nation agreement with Cuba (February), and by an exchange of notes (November) kept alive a denounced treaty of commerce with Siam.

A new arrangement among the Oslo Powers (Belgium-Luxemburg, Denmark, Finland, Netherlands, Norway, Sweden) was signed at The Hague on May 28. Belgium-Luxemburg and the Netherlands undertook to admit without restriction the import of a long list of goods from the other signatories, and not to take any initiative tending to increase duties on such goods or to impose new ones. The Scandinavian countries and the Netherlands

East Indies similarly pledged themselves not to increase or impose duties on other lists of goods, nor to subject to quantitative restriction imports from the signatory countries of any listed goods then entering duty free.

Among other European trade agreements made in 1937, those of France may be specially mentioned. The Franco-Canadian pact has been recorded above. Franco-German commercial and payments agreements were signed in July. France granted most-favoured-nation and minimum-tariff treatment to specified German goods, comprising most tariff items, and also consolidated the duties on a long list of articles. Germany, in return, reduced or consolidated duties on an important list of French goods. Should any of these concessions be withdrawn, with due notice, by either party, the other could request the opening of negotiations between special Government committees created to settle questions arising out of the agreement. Under the payments pact, all clearing arrangements were set aside. The exchange resulting from German exports to France would be made available (after certain deductions, including a proportion of free exchange for the use of the Reichsbank) for buying French goods. Private compensation transactions were forbidden. In May, a Franco-Polish trade treaty was concluded, to replace an agreement of 1936. Most-favoured-nation and minimum-tariff concessions were exchanged. France reduced duties on Polish sheep and mutton, Poland her duties on wines, fancy leather, hosiery, etc.; Poland also promised safeguards for the local names of French wines—a common feature of French commercial pacts. During 1937, France also signed agreements, on most-favoured-nation lines, with Switzerland (April), Haiti (April), Ecuador (August), Latvia (October), Estonia (November). Her treaties with Honduras and Siam, on the other hand, were denounced. (H. V. H.)

**Trades Union Congress.** The British Trades Union Congress, founded in 1868, is a voluntary association of trade unions which meets every year in September, and now represents 214 unions with a membership of 4½ millions. Its executive work is carried on by an elected general council of 32 members. Its activities during 1937 covered many questions of trade union organization, attention being concentrated in the main on the distributive trades, youth, the nursing profession, and women's organization, all of which are numerically backward in trade unionism.

In the realm of health and welfare, much attention was devoted to improving factory legislation, to the schedule of industrial diseases, to improvements in workmen's compensation, health and unemployment insurance, and especially to trying to secure increased benefits and allowances. Holidays with pay were the subject of evidence submitted to a government commission, the Trades Union Congress seeking to establish 12 days' paid holidays after 12 months' employment, and other holidays proportionate to length of service.

In conjunction with the British Medical Association, a scheme was submitted for the rehabilitation of injured workmen, to be operated in association with the hospital fracture clinics. Other matters under review were a national maternity service and a comprehensive public health service.

In the educational sphere, scholarships were granted for young workers to Ruskin college, Oxford; and many week-end schools and a summer school were held on trade union subjects. Students were also sent to the summer school of the International Federation of Trade Unions at Brunnsvik, Sweden, and to the International Labour Office at Geneva. Representations to the education authorities were made to minimize the adverse effects of the exemption clauses of the Education Act, 1936.

Preliminary steps were taken to create a Scientific Advisory

Council, on which eminent scientists will work in association with the Trades Union Congress; and an advisory committee of experts was appointed to inquire into the conditions of native labour in the British colonies and dependencies.

Among Government and other bodies upon which Trades Union Congress representatives served, were committees and commissions to investigate the cost of living index, the geographical distribution of industrial population, the fair wages clause, and workmen's compensation.

The main subjects discussed at the Norwich congress of 1937 concerned the pensions scheme, promoted in association with the Labour Party to increase pensions to £1 a week at 65 and 35s. for married couples; the establishment of the 40-hour week; holidays with pay; action against the spread of Fascism; the conflict in Spain; Japanese aggression in China; and national defence policy, where the view was expressed that Great Britain needed to be equipped to meet the danger of war and to play its full part in developing collective security and resisting intimidation from any aggressive power. (W. M. C1.)

**Trade Unions:** see LABOUR UNIONS.

**Traffic Laws and Offences.** There have been no striking developments in traffic laws or enforcement methods during the year 1937 in the United States. Such changes as have taken place are the result of gradual improvements during the past several years. Beginning in 1934 there was a resumption of an increase in automobile registration and use due to improved economic conditions. This led to a marked aggravation of traffic difficulties in the two fields of traffic accidents and traffic congestion. Most of the larger cities are hard pressed to maintain a reasonable semblance of safe and orderly movement.

To meet this situation, there has been the development of no new techniques in traffic control methods, but rather a refinement in methods already established. There is a growing emphasis upon the use of factual information as a basis for legislation and control methods in general. For this many cities are better equipped than heretofore due to traffic surveys conducted in recent years largely as relief activities.

Concurrently, there is a growing recognition that the planning of control methods must be delegated to properly trained experts. To this end there has been established a graduate training school in the Harvard university Bureau for Street Traffic Research where from 25 to 30 graduate engineers are trained and placed each year. This training agency is provided with 23 fellowships, 15 from the Automotive Safety Foundation, and eight from the Alfred P. Sloan, Jr. grant.

Parking regulations caused the greatest concern to American cities in the year 1937. This has been partly due to the fact that curb parking increases traffic congestion and partly due to the fact that business is discouraged because many who wish to conduct business cannot find parking places. Many cities have installed parking meters usually requiring the deposit of five cents per hour for permission to park at the curb. Other cities, most notably New York, have provided increasingly rigid control of parking upon the more crowded streets. (M. McC.)

**Great Britain.**—No new legislation regarding motors, motor-ing, or the use of the roads was passed in Great Britain in 1937, but several new regulations were issued by the Ministry of Transport under existing statutes. On Jan. 1 an Order in Council came into force, making various new regulations as to the construction and use of motor vehicles, requiring the use of guard rails on commercial vehicles, making the use of safety glass for wind-screens and all front windows compulsory, and compelling the fit-

ting of an efficient screen-wiper on all fixed wind-screens. New lighting regulations came into operation on Oct. 3, providing that all head-lamps must be fitted with an anti-dazzle device which will deflect the beams of light downwards and to the near side, so that they cannot dazzle a person standing 25ft. away whose eye-level is not less than 3ft. 6in. from the ground; or alternatively that head-lamps must be capable of being extinguished at the same time as other anti-dazzle lamps are brought into operation. The power of side-lamps must be limited to 7 watts, and frosted or other light-diffusing glass must be used for them. It was announced during the year that the Traffic Advisory council is considering, on the Government's behalf, the possibility of requiring cyclists to be registered, and of introducing riding tests, penalties for careless riding, and compulsory rear-lights for cycles. The minister of Transport has also under consideration the question of compelling all cars to carry a device restricting speed to 30 m.p.h. in all built-up areas. In December it was announced that a Select Committee of the Lords was being set up to consider the problem of lessening road fatalities. For statistics of motoring offences in Great Britain see *CRIME: Great Britain*.

**Trailers:** see *TOURING AND TOURIST CAMPS*.

**Trans-Arctic Flying:** see *ARCTIC EXPLORATION*.

**Transbay Bridge:** see *BRIDGES*.

**Trans-Jordan.** Trans-Jordan lies to the east of Palestine, and is bounded on the north by Syria, on the north-east by Iraq, on the south-east and south by Saudi Arabia. Great Britain, as a mandatory of the League of Nations, is responsible for its administration. The powers conferred by the Mandate are, in fact, exercised, as the result of an agreement made in 1928, by His Highness the Amir Abdullah ibn Hussein, through the constitutional machinery defined in an organic law. The Amir is advised by a British resident responsible to the high commissioner, who is also high commissioner for Palestine, and resides at Jerusalem. The capital of Trans-Jordan is Amman. The national flag consists of three equal horizontal stripes of black, white, and green, with a red triangle based on the flagstaff side and containing a seven-pointed white star.

**Area and Population.**—The area of Trans-Jordan is 34,000 sq. mi., and the population, of which no census has yet been taken, is about 300,000. Arabic is the official language and the medium of education.

**History.**—The outstanding political event of the year was the publication of the Peel Commission's report (see *PALESTINE*). If its proposals were to be carried out, Trans-Jordan would be amalgamated with the larger but less fertile part of Palestine, and would acquire outlets to the Mediterranean at Gaza and Jaffa. At the same time, it would become, through the termination of the Mandate, a sovereign State. The plan has obvious attractions for the Amir, but the strength of Arab feeling against the partition of Palestine, both in the neighbouring States and in Trans-Jordan itself, is also an important factor in the situation.

**Trade, Communications, Finance.**—The total value of imported goods in 1936 was £P794,956. There are no complete statistics of exports, but the balance of trade is known to be unfavourable. A boycott of Jewish goods in 1936, coupled with the devaluation of the franc, led to an increase in trade with Syria, at the expense of Palestine. Imports carried through Syria, which in 1933 had been only 5% of those brought through Palestine, rose in 1936 to 84%. The unit of currency is the Palestinian pound, at parity with sterling. The budget of Trans-Jordan is balanced by means of grants-in-aid from the Mandatory Power. The estimated revenue for 1936–37 was £P420,000, of which only £P277,000 was to be raised locally.

**Trap-shooting.** The Grand American Trap-shooting championship of 1937, held under the auspices of the Amateur Trap-shooting Association, at Vandalia, Ohio, during the week of Aug. 20, 1937, was attended by more than 1200 shooters. It was the thirty-eighth annual championship. Approximately 750,000 clay targets were trapped. Only three times in the history of the "Grand" have 100 straight targets been shot, including once in 1937, made by Frank G. Carroll, the Grand American Handicap winner at 19 yards; eleven shooters broke 99x100, one target behind the winner. Winners of other classes were:

J. W. Egernan, preliminary handicap, 99x100.

Phil R. Miller, clay target championship of America, 200 straight

Hale C. Jones, champion of champions race, 100x100

Ned Lilly, doubles champion of North America, 98x100

Clyde Mitchell, professional doubles championship, 98x100

Mrs. Lela Hall, women's championship, 194x200

Mr. and Mrs. Fred Hess, husband and wife, 383x400

Tom Lovett, high on 600 16-yard targets, 598x600

R. A. King, high on all targets, 881x900

East-West team winner, West team, 1964x2000

Charles A. Bogert, class championship AA, 200x200

Stanley Meadows, class A championship, 200x200

William Horton, class B championship, 199x200

R. V. Polen, class C championship, 198x200

M. J. Swanick, class D championship, 198x200

J. C. Baker, class E championship, 194x200

Clyde Wells, professional champion, 200x200

State winner, Wisconsin, 982x1000

Stanley Meadows, junior champion, 98x100

Rudy Etchen, sub-junior champion, 95x100

Joe F. Hiestand, long yardage champion, off 25 yards, 93x100

Second in importance in trap-shooting in the U.S., is the Amateur Trap-shooting championships of America, held at the Travers Island traps of the New York Athletic club, May 7–9, 1937, attended by 200 leading nimrods. Walter Beaver was crowned amateur champion of America, with a score of 198; Tracy H. Lewis, second, 197; Joe F. Hiestand and S. M. Crothers, tied for third, each with 196. Doubles champion, Joe F. Hiestand, 98x100; second, A. J. MacDowell, 87x100. Champions of the N.Y.A.C.: Tracy H. Lewis, singles; Charles W. Phellis, doubles; Selah B. Masten, distance.

In the New York State shoot, at Ithaca, N.Y., the winners were: G. C. Lindsley, 200x200; R. H. Helsel, doubles, 194x200; J. A. Seegar, handicap, 97x100. Championships are held in almost every state in the U.S. (J. B. P.)

**Triborough Bridge:** see *BRIDGES*.

**Trinidad and Tobago,** British West Indian colony comprising Trinidad and Tobago islands off the coast of Venezuela; language, English; capital, Port of Spain (pop. 75,680); governor, Sir A. G. M. Fletcher. The area is 1,980 sq. mi., (Trinidad, 1,862 sq. mi.). Population (1931 census) 412,783 (387,425 in Trinidad); (official estimate, 1936) 448,253. East Indians comprise 30% of the population. In June serious strikes by unorganized labour in the oil fields

and the sugar plantations spread to Port of Spain, paralyzing business for a day. Serious rioting occurred, but was suppressed by the local police before the arrival of two British cruisers which had been summoned by radio. In December, the strike leader was tried for sedition and sentenced to two years at hard labour. Meanwhile, a royal commission began a formal investigation.

Trinidad has excellent steamship lines and air service. There are 123mi. of railroad, 1,083mi. of main highways. Imports for 1936 totalled \$27,187,994, and exports \$29,944,534 (besides \$5,836,607 in transit from Venezuela), representing a 20% gain. Trade is principally with Great Britain, the United States and Canada, which account for 40%, 17%, and 12% of imports, and 44%, 15%, and 11% of exports. Leading imports are machinery, foodstuffs, and cotton textiles. Petroleum and asphalt comprised 59.07% of exports in 1936, with sugar and cocoa next. The principal agricultural products are sugar, cocoa, coconuts, and citrus fruits. Petroleum and asphalt are the leading resource. The monetary unit is the Trinidad dollar fixed by law at 4.40 to the pound sterling (value: approximately \$1.04 U.S.). Revenues for 1936 were \$12,560,314; expenditures were \$9,170,686. Public debt was \$20,274,816 in 1936. In 1936, there were 301 primary and other schools, with an enrolment of 76,350, and four teacher-training colleges.

(L. W. BE.)

**Tristan da Cunha.** A British possession, the only permanently inhabited island of a south Atlantic group including Inaccessible island and the three Nightingale islands, in Lat. 37° 6' S., 12° 2' W., far removed from any sea route, and having only an exposed roadstead. Arrangements are made for the islands to be visited at intervals of about a year, generally by a cruiser from Simonstown, South Africa. The population of under 200 are descendants of a garrison placed there during Napoleon's imprisonment at St. Helena, many of them being descendants of Corporal Glass of that garrison. The island is self-supporting, but dependent for comforts on visiting ships and gifts collected by missions in England. Since 1933, there has been a resident chaplain, the Rev. Harold Wilde, maintained by the Society for the Propagation of the Gospel, who acts as doctor, schoolmaster, and magistrate. There are about 170 cattle, 600 sheep and other livestock, and potatoes are raised. In 1937, plans were in preparation for a short stay by a meteorological expedition.

**Trotsky, Lev Davidovich** (1877– ), Russian statesman and international revolutionary leader; since Jan. 1928 an exile, first at Alma Ata, later at Prinkipo (in the sea of Marmara), in France and Norway, and since the end of 1936 in Mexico, from which country he has continued propagandist activities in opposition to the current Stalinist policy of the Comintern. In Feb. 1937, in an interview, Trotsky accused the Soviet Union of "sabotaging" Spanish democracy by withholding its support in the interests of France. A statement issued in June confirmed the existence of a Trotskyist "Fourth International" with a membership of 30,000; and in the same month Trotsky telegraphed to the central executive committee of the Russian Communist Party at Moscow denouncing Stalin and his policy and calling for a reconstruction of the Soviet régime on democratic lines. In the autumn, a slight slackening of the "anti-Trotskyist" purgative measures of the earlier part of the year taking place in Russia (see UNION OF SOVIET SOCIALIST REPUBLICS), rumours arose of attempts at mediation between Trotsky and Stalin which might bring about the former's return.

During the year Trotsky issued "The Revolution Betrayed," an attack on the Stalin régime and a further attempt to prove the impossibility of maintaining a revolution in a single country.

**Trotting,** probably the least publicized of major outdoor American diversions, not only recorded many outstanding track achievements in 1937 but due to an increased public favour resulted in race attendance figures far exceeding those of recent years. No less than 815 harness meetings were officially sanctioned in 1937 in the United States and Canada. The equipment of the operating tracks together with the aggregate of stakes and purses competed for, plus the investment in and the maintenance of racing stables and breeding farms, represented millions of dollars. No other sport in the world employs an investment equal to the outlay devoted to harness racing in America.

The highlights of the 1937 trotting season were many and epochal, among them being the October performance of the five-year-old Greyhound in 1.56 to surpass the previous trotting mark of 1.56½ in 1922 by Peter Manning; the 1.58½ mile by the three-year-old Dean Hanover, driven to a new world record for trotters of his age by Miss Alma Shepard, an eleven-year-old schoolgirl; and the surprising and decisive victory of Shirley Hanover 2.01½ in the \$40,000 Hambletonian in August at Goshen, N.Y. Nor were Dean Hanover's three race heats in 2.00¼, 2.00¾, 2.00¾, a new competitive record for trotters of any age, a less impressive record.

The season-end auction sales of yearlings from the more prominent trotting nurseries established new high sale averages, indicating a healthy demand for juvenile race candidates for 1938; and the seasonal exportations of race material of breeding stock to Continental Europe climbed to new high levels not only in export units but in the ultra-types which were sent abroad. Italy, Sweden, Denmark, Belgium, and Germany were the most liberal purchasers, the trans-Atlantic voyagers including the 1937 Kentucky Futurity winner, Twilight Song (2.01¼), exported to Italy in a \$20,000 transaction.

(F. P. KE.)

**Trucial Sheikhs:** see ARABIA.

**Truck Farming.** While Germany rigidly restricted truck farming, in favour of wheat, rye and other staple crops, including potatoes, elsewhere this branch of agriculture tended to increase in 1937. The Canadian acreage in peas was 92,500 in 1937, compared to 84,000 in 1936; beans, 67,600ac. in 1937 and 64,000ac. in 1936. In the U.S. the area planted to vegetables reached a new record high, estimated by the U.S. Department of Agriculture at about 10,500,000ac., or approximately 3% of all land planted to crops. Production of nearly all truck crops was increased, with the principal exception of onions and artichokes.

Much of the acreage of vegetables for canning was abandoned in 1936 because of drought, but in 1937 there was a new high of approximately 1,580,000ac. for canning. The U.S. Department of Agriculture points out that the canning acreage seems to run in five-year cycles, with three years of expansion during which supplies of canned goods are accumulated above requirements, and then two years of decreased acreages.

Truck crops for marketing have increased steadily in the U.S. from 966,000ac. in 1925 to a previous high of 1,661,000 in 1936, which acreage was exceeded slightly in 1937. The acreage of dry edible beans in 1937 was 1,794,000 acres. For the five years ending in 1935 the acreage of truck crops both for canning and marketing increased by about 50%. The gross income from vegetables, including white potatoes and sweet potatoes, exceeds that of most other major crops, including the grains and tobacco.

About 44% of the vegetable and fruit crops in the U.S. move to market in trucks. There are no separate figures for vegetables, but it is estimated that after the vegetable and fruit crops reached urban markets in 1936 expense of further distribution to

LITTLE ENGLISH GIRLS in a London clinic taking treatments from sun lamps provided by the British Government

the consumer through wholesaling, jobbing, retailing and urban trucking cost \$1,500,000,000. Studies made of vegetable markets in 40 cities indicate that market facilities are greatly antiquated and that substantial economies could be effected by providing better located and equipped markets, especially as to prevention of congestion in truck space.

Marketing of fresh vegetables in frozen form increased greatly in 1937 and included peas, snap beans, lima beans, sweet corn, spinach, asparagus and broccoli. In all about 75 fresh products are now marketed by the "quick freeze" industry and 30,000,000 lbs. of fresh, frozen vegetables, fruits and meats were in storage December 1.

West coast, Mexico, plantings of tomatoes for 1937-38 were about 18,500 ac., from which a crop of 3,000 cars is predicted. Tomato planting in the Bahamas was about 1,000 acres. The Cuban tomato crop was short, owing to weather damage, and exports were also lower because of new grading rules.

(S. O. R.)

**Trucks:** see MOTOR TRUCKS.

**Tuberculosis.** As the first step in the detection of tuberculosis, the tuberculin test has been applied to more than a million persons throughout the United States in 1937. Its place in the tuberculosis control program was evaluated by Harrington and others. Purified Protein Derivative as a testing material has been found fully as effective as Old Tuberculin and has the advantage of being well standardized.

The Tuberculosis Committees of the American Association of School Physicians and the American Student Health Association recommended the use of the tuberculin test for students and personnel of all school systems. The American Student Health Association reports that only 30% of college and university students have been found to react positively to the tuberculin test, whereas, in high schools in many parts of the nation only 10 to 15% react to the test. Whole cities inaugurated tuberculosis control programs through publicity in newspapers and over the radio, with the result that large numbers of adults have had the tuberculin test administered and X-ray examinations of the positive reactors. Magazines, particularly *Life*, *Look*, and the *Literary Digest*, have aided greatly by publishing well illustrated articles during the year.

A special method of making X-ray examinations, known as tomography, has been carefully studied. It eliminates shadows

cast by parts of the body lying behind or in front of the area of disease in the lung. X-ray cameras capable of making a thousand exposures a day on large rolls of paper film at markedly reduced cost are solving the X-ray problem. The Medical Society of the County of Queens in New York State together with the local tuberculosis association, has examined large numbers of children and adults in this manner. In Cuba the tuberculosis program has been placed on a nation-wide basis through the use of the rapid method of making X-ray film examinations of the chest. Already hundreds of thousands of examinations have been made in this way. Final diagnosis cannot be made from the X-ray film. For example, in miliary disease it fails to reveal any evidence whatsoever in 50% of the cases. The X-ray film is used only to weed out those with shadows in order that they may be completely examined to determine whether the shadows are due to tuberculosis.

As an aid in determining the presence and progressiveness of tuberculosis, numerous workers have used the red blood-cell sedimentation test and differential white blood-cell counts. Sweany has developed a composite blood chart which can be used to advantage in observing the course of tuberculosis. Through the bronchoscopic examination, tuberculosis of the trachea and bronchi can be detected when all other methods of examination fail. Serious tuberculosis develops more often among persons who suffer from silicosis than among those of the general population.

Hospital beds for the isolation and treatment of the tuberculous have been increased by the construction of new sanatoriums in such States as Florida and North Carolina. The total capacity of such institutions was in 1937 approximately 80,000. General hospitals are admitting about 35,000 tuberculous patients annually. The sanatorium is no longer looked upon as an institution only for the treatment of the ill; its staff takes part in the public health activities of the district it serves.

The use of collapse therapy in all forms has been widely extended. Numerous articles have appeared in such publications as the *American Review of Tuberculosis*, the *Journal of the American Medical Association*, and the *Journal of Thoracic Surgery*. An excellent book on this subject by Alexander appeared during the year. Lindsag removed an entire lung which contained extensive tuberculous disease. Pneumoperitoneum has been introduced in a rather extensive way to bring about an elevation of the diaphragm and thus reduce the movement of the lungs to aid in controlling pulmonary tuberculosis.

Inasmuch as children rarely develop chronic tuberculous disease in serious form, the emphasis in the campaign against tuberculosis has shifted to adults, beginning with the period of adolescence and carrying through senility. Diehl and others have called attention to the fact that adults previously uninfected develop the same type of tuberculosis as the child, if they come in contact with tuberculous patients. Jennings reports the incidence of tuberculous disease among persons beyond the age of fifty years is definitely increasing. A geographic study of the distribution of tuberculosis mortality in the South-eastern United States reveals the areas of concentration of disease. A complete map of the United States is now being prepared. The tuberculosis mortality rate in the United States has been reduced from 200 per 100,000 in 1900 to 55-60 per 100,000 in 1937.

The control of tuberculosis among the fifty-five million cattle of the United States has progressed rapidly. At the close of 1937 all but two States were accredited. Tuberculosis among swine and chickens has been recognized as a serious economic problem in some sections and great effort was put forth this year to solve this problem. The control of tuberculosis among animals has materially aided in reducing the disease among human beings.

The best work in the prevention of tuberculosis is being accomplished by avoiding exposure or setting up barriers between those who have the disease and the uninfected. Attempts to produce immunity through vaccination with BCG have continued but reports showing unsatisfactory results have led to much controversy. Therefore, enthusiasm for the method is definitely on the wane in many places. The veterinarians of the United States have completely abandoned BCG in their program of tuberculosis control among cattle. Efforts to desensitize animals and human beings to tuberculo-protein, thus minimizing the severe reactions from endogenous and exogenous reinfections with tubercle bacilli, have progressed. Rehabilitation of tuberculous patients whose former work was of such a nature as to be hazardous after recovery is being accomplished through re-education.

The sale of the double-barred cross tuberculosis Christmas seal through the component organizations of the National Tuberculosis Association has continued to gain in favour with the public, as indicated by the interest manifested. The annual income from this seal amounts to four or five million dollars, which is used largely in a nation-wide campaign of education.

For statistics see PUBLIC HEALTH SERVICES. (J. A. My.)

## Tukhachevsky, Mikhail Nikolaevich

(1893-1937), Russian soldier and youngest of five field marshals of the Soviet Union, was one of eight generals shot upon charges of Trotskyism and treason on June 12, 1937. Born the son of a provincial nobleman in 1893, he helped Trotsky build the Red Army and succeeded to the posts of Chief of the Military Academy and Assistant Chief of Staff of the Red Army. A short account of his life is to be found in the *Encyclopædia Britannica*, vol. 22, p. 538.

## Tungsten.

The world's tungsten producing industry centres mostly in South-eastern Asia, where about 77% of the total originates, 37% from China, 24% from Burma, 10% from Malaya, and 6% from other adjacent territory. Of production elsewhere, the United States supplies about 10%, and about the same is furnished by Bolivia and Portugal, in about equal amounts; other outputs are small and widely scattered. The world total in 1930 was 16,700 metric tons of concentrates carrying 60%  $WO_3$ , declining in 1932 to 6,800 tons; this has steadily improved, reaching about 22,000 tons in 1935, with a further, still undetermined increase in 1936 and 1937. In spite of disturb-

NEW YORK CITY ENTRANCE to the Lincoln tunnel under the Hudson river, connecting with Weehawken, New Jersey

ances incident to the Japanese invasion of China, the Chinese exports for the first half of 1937 were well in advance of those for 1936, but information is still lacking as to developments later in the year; exports from Burma during the same period also showed marked increase.

The United States industry is very erratic, and in spite of exceptionally heavy tariff protection is more or less at the mercy of world prices. An output of 1,100 metric tons in 1928 decreased in 1929 and 1930, but rose to 1,270 tons in 1931, and again declined to 360 tons in 1932; since then increases have been regular, reaching 2,270 tons in 1935 and 2,380 tons in 1936.

With one war scarcely finished, two more in active progress, and rearmament measures under way in at least half a dozen of the leading nations, the demand for tungsten is insistent, and bids fair to continue so for some time to come. (See also MACHINERY AND MACHINE TOOLS.)

(G. A. Ro.)

**Tunis**, a French protectorate in North Africa, lying between Algeria and Tripoli and extending to the Sahara. The ruler is the bey, Sidi Ahmed, under the direction of a French resident-general, M. Armand Guillon. The capital is Tunis. Area 48,300 sq.mi.; population (1931) 2,410,692, including 195,293 Europeans. The inhabitants are predominantly Mohammedan. Education is fairly well advanced.

**History.**—The coming into power of the Front Populaire in France was the signal in Tunis for disturbances (see also ALGERIA). The administration of the resident-general, M. Guillon, sometimes, particularly in the first months, showed weakness in dealing with the instigators of risings. Strikes took place at Met-laoui (19 killed, 27 wounded), and at M'Dilla on March 4 and 5. One of the leaders of the Nationalist movement, Habib-Bourguiba, manager of *L'Action Tunisienne*, returning from a stay in France, declared in an interview on May 6 that he had confidence in the Front Populaire, and that "we are in a state of war with our enemies" (meaning the French). On July 9 the "father of the *Destour*," Sheikh Talbi, coming from the East where he had been exiled, was welcomed with enthusiasm. But his understanding with the young *Destouriens* was of short duration. Encounters took place between the partisans of the old *Destour* and the militant wing of the new.

In July, the resident-general promulgated a series of decrees reorganizing the administration and making changes in the person-

## TUNNELS

nel. This action may probably presage a more energetic policy and a reduction in the number of French officials.

A serious incident took place at Tunis on Sept. 20, when naval cadets from two Italian training-ships put themselves at the head of Italian Fascists and attacked the local offices of the Italian League for the Rights of Man and two other clubs, and killed a man. Considerable feeling was aroused in Tunis, and diplomatic protests were sent to Rome.

**Trade and Communications.**—The principal products are wheat, barley, oats, wine, and olives; and there is an increasing output of phosphates. There are nearly 1,300mi. of railways, and about 3,900mi of roads. Tunis is connected by air with Marseilles by Air France, and with Rome by Ala Littoria. (R. PIN.)

**Tunnels.** The sciences and arts applied to tunnel design and construction have made such advances during the past thirty years that today with the basic tunnelling costs of labour and materials two to three times greater, one finds that the field cost of the product in some cases is but little greater and in exceptional cases less. This greater feasibility of driving in soft or instable ground and rock has encouraged adoption of tunnels especially for railways, highways, and aqueducts under barriers such as cities, waterways and mountains. The increased use of mechanical equipment is however limiting the opportunity to train young miners in the higher art of holding ground forces in cases where only manual work is possible.

The Independent subway of New York city partly in use several years ago is now in full use with over nine miles of its length in tunnel. In London where practically all underground transit is in tunnel, another 16 miles of route or 32 miles of tun-

LINCOLN TUNNEL, second motor trafficway under the Hudson river connecting New York and New Jersey. The view shows the first tube of the tunnel, to which a second, parallel tube is to be added by 1941

TUNNEL CONSTRUCTION. Installing air locks through which men and materials pass between the section already excavated and the boring chamber where heavily compressed air keeps out water and silt

nel was begun, but generally under ground conditions more favourable than prevail in New York. New York also on December 21 opened a highway tunnel constructed by the Port of New York Authority in the peculiar silt under the Hudson river. Construction of a parallel tunnel was begun early in 1938. In addition, the construction of a pair of highway tunnels under the East river to Queens was begun—a work of considerable geological proportions in rock variegations and glacial formation. London began construction of another highway tunnel under the Thames at Purfleet and is seeking Parliamentary powers to duplicate the Blackwall highway tunnel built in 1895. Many tunnels are under construction throughout the world for hydroelectric, water supply, irrigation and other uses, some of great length and some of great dimensions.

The 31 tunnels in rock of the Colorado aqueduct represent almost 80mi. of tunnelling.

Recent tunnelling with the aid of compressed air has not required any high degree of air pressures. Labour laws by diminishing working shifts when air pressures exceed 18lbs. per square inch have greatly increased costs. Added processes and comforts on behalf of health and safety have given the workers greatly increased immunity from compressed air troubles. In view of alleged acquisition of silicosis in rock tunnel construction and labour acts concerning the disease at large, investigations and dust control experiments are being conducted. While the protection of the health of the workers is of prime importance this present consciousness is particularly interesting so far as it concerns rock tunnels where practically all drilling is now wet and has been for over 20 years. A recent survey of Great Britain reveals that the death rate of hewers from 20 to 55 years is less than the death rate of all males up to the age of 55 years and beyond that but little greater.

The following selected list gives some of the longest railroad tunnels measured from portal to portal.

Name	Location	Length
Simplon	Alps	12.3 mi.
St. Gotthard	Alps	9.3 mi.
Loetschberg	Alps	9.0 mi.
Mt. Cenis	Alps	8.0 mi.
New Cascade	Washington	7.8 mi.
Moffat	Colorado	6.2 mi.
Rogers Pass	British Columbia	5.0 mi.
Hoosac	Massachusetts	4.7 mi.
Otira	New Zealand	5.3 mi.
Severn	England	4.4 mi.
Apennine	Italy	11.5 mi.
Shimizu	Japan	6.1 mi.
Mt. Royal	Montreal	3.3 mi.
P.R.R.	New York	2.6 mi.

(J. FE.)

**Turkestan, Chinese:** *see* SIN KIANG.

**Turkey**, republic of the Near East, comprising Asia Minor, the greater part of Armenia and Kurdistan, and a part of the European peninsula between the Black sea and the Aegean; since 1923 a republic under the presidency of Kamâl Atatürk, formerly Ghazi Mustafa Kemal, last re-elected to that office in March 1935, with a single-chamber legislature (the Kamutay) of 399 members and an executive consisting of ministers chosen by the president.

**Area and Population.**—Area, 295,000 sq.mi., of which about 9,250 sq.mi. are in Europe. Population (1935 census), 16,200,000, of various races, including considerable numbers of Kurds, Jews, Armenians, etc., who are in great majority Mohammedans, though Islam is no longer legalized as a State religion: in European Turkey and the Armenian districts there are many Christians. Education is free and compulsory, and very rapid strides have been made in this field in the last few years: in 1934-35 there were about 6,500 elementary and 120 secondary schools, with some 650,000 and 50,000 pupils respectively. Universities exist at Ankara and Istanbul. The capital is Ankara (pop. 125,000), but Istanbul (formerly Constantinople) is by far the largest city, with a population of *c.* 745,000. Izmir (Smyrna) has 170,000 inhabitants, and four other towns pass the 50,000 mark.

**History.**—In Feb. 1937 three constitutional amendments were adopted by the Kamutay or National Assembly, the first adding to the clause establishing the Republican form of government a declaration that the principles of the Republican People's Party should be followed, the second allowing for the expropriation of large rural properties for the benefit of the peasants, and the third denying the general religious freedom to sects suspected of holding secret meetings for their rites. On Sept. 27 the premier, Gen. Ismet İnönü, who had held office for 12 years, resigned, being succeeded by Djelal Bayer, a banker, and former minister of National Economy, the personnel of whose new cabinet was announced on Nov. 9.

The refortification of the Dardanelles, which had been consented to by the League of Nations in Nov. 1936, was agreed to by Italy in Feb. 1937, but Germany at the end of the same month raised certain objections to the Montreux Convention by which the question had been regulated. In February, negotiations began for a new clearing agreement with Germany; and in May friendship with Greece was reaffirmed by Gen. İnönü, the premier, during a visit to Athens. A trade agreement with Japan was concluded in August, and Turkey was a party to the treaty of Saadabad (*see* ISLAM) signed in July. The Turco-Syrian treaty of 1926 was denounced in December. In August, Turkish patrols in the Dardanelles were doubled, after attacks on Spanish Government shipping there had been made by unidentified submarines; and after Turkey had become a party to the Nyon agreement of September her naval forces in that quarter were

further reinforced. (*See also* ALEXANDRETTA, SANJAK OF.)

**Agriculture.**—Agriculture is Turkey's chief industry; wheat, barley and other cereals, tobacco, figs, raisins, and nuts being the chief vegetable products. The mineral resources, though not yet extensively developed, are great, and include chrome, coal, and copper. A three-year plan for the development of this mineral wealth was approved in 1937 envisaging the doubling of the coal and chrome output. Manufactures are being rapidly developed; an initial five-year plan of industrialization is almost completed, and a second began with 1937, largely devoted to the erection of power stations and the equipment of yards in which Turkey may build her own ships. Communications are being overhauled and extended throughout the country: over 4,000mi. of railways are already opened, and some 600mi. are under construction. In 1937 Turkey owned some 195,000 gross tons of merchant shipping.

**Banking and Finance.**—The 1937-38 budget balanced the country's revenue and expenditure at £37,400,000, allowing in addition for an extraordinary credit of £6,000,000 for defence and public works. Income and land taxation, customs, and certain State monopolies are the principal sources of revenue. Trade figures for 1936 indicate imports of *c.* £15,320,000 and exports of *c.* £19,620,000. There are five State-controlled banks, besides the new Deniz or sea bank established in 1937 to concern itself with maritime trade. The monetary unit is the lira or Turkish pound of 100 piastres, nominally valued at 18s. sterling, but exchanging at the end of 1937 at the rate of 6.20 Turkish pounds to the pound sterling.

**Defence.**—Military service is universal and compulsory: the effective strength of the army is about 200,000 officers and men, that of the air force about 9,000, with about 400 first-line aircraft. The navy includes four battleships and cruisers, with smaller craft. In 1937 a law made women equally with men liable for military service.

**Turkmen S.S.R.**, a member of the U.S.S.R. (*q.v.*), lies between the Caspian sea in the west, the river Amu-Darya in the east, the republics of Kazakhstan and Uzbekistan in the north, and Iran and Afghanistan in the south. The capital is Ashkhabad, and the national flag, a red ground, with gold initials TCCP in top left corner. Of the leading cities Ashkhabad had in 1936 102,500 inhabitants, and Krasnovodsk 27,000. Area: 444,000 sq.km. chiefly comprising the Desert of Kara-Kum. The sparse population lives for the most part in the oasis districts in the south and east. Population (1933), 1,269,000 (rural 1,024,000, urban 245,000), of whom 72% were Turkmen. On March 2 the new Constitution was adopted by the Sixth Extraordinary Soviet Congress in Ashkhabad. The republic consists accordingly of 2 regions and 32 districts. Sown area (1936) 15,282 square miles. The main occupations are cotton growing in the oasis regions, fruit cultivation, cattle farming (caracul sheep), and riding-horse breeding. Natural resources include oil and sulphur. The retail trade turnover (1936) was 0.8 milliard roubles. Exports: cotton, fruit, oil, carpets, caracul. The 1936 output of industry (at prices 1926-27) was 214,000,000 roubles; and that of electricity, 48,000,000 kilowatt-hours. The only railway line is from Krasnovodsk on the Caspian sea to Cohardzhuy, with a branch line from Merv to Kushka. (S. YAK.)

**Turpentine:** *see* CHEMISTRY, APPLIED.

**Tweedsmuir, John Buchan**, 1ST BARON, G.C.M.G., C.H. (1878- ), governor-general of Canada. Private secretary to Sir Alfred (Lord) Milner in South Africa (1901-03), Mr. Buchan was on the head-

quarter staff during the World War (1916-17), and became widely known as a writer of novels and romances, also of a *History of the Great War* and some biographies; he was M.P. for the Scottish universities 1927-35, and Lord High Commissioner to the Assembly of the Church of Scotland, 1933 and 1934. He was appointed governor-general of Canada in March 1935, was raised to the peerage, and on November 2, assumed office. In March 1937, Lord Tweedsmuir created a precedent by paying an official visit to President Roosevelt in Washington, Mr. Roosevelt having called upon him in Ottawa in the previous year. In May he went among the Mohawk Indians on their reservation at Brantford, Ont.; then came a two months' tour of the Far West of Canada, the Mackenzie delta, Hudson's bay, and the Arctic portion of the Dominion, when Indian chiefs and Eskimos were visited. A trip to Nova Scotia followed. Lord Tweedsmuir's life of the Roman Emperor Augustus appeared in October 1937, and in December he was elected chancellor of Edinburgh university.

**Tyrol:** see AUSTRIA.

**U-Boat Pirates:** see MEDITERRANEAN, THE.

**Uganda.** A British protectorate in East Africa, extending from S. lat. 1° to the northern limits of the Albert Nile at Nimule, the eastern boundary being a line drawn from Mount Zulia on the Sudan border along the Turkana escarpment to the crater of Mount Elgon, and thence along the Malwa and Sio rivers into the north-eastern waters of Lake Victoria; the territory is bounded S. by Tanganyika territory, and W. by the Belgian Congo. Uganda is directly administered by the governor, Sir P. E. Mitchell, K.C.M.G.; but the province of Buganda is recognized as a native kingdom under a *kabaka*, H. H. Sir Daudi Chwa, K.C.M.G., a grandson of Mtesa. The administrative capital is Entebbe, and Kampala is the business centre. The area is 93,981 sq.mi.; and the population (1931 census) was 3,556,267 Africans, and the estimated number of Europeans and Asiatics is 2,000 and 15,000 respectively.

Education for African boys begins in sub-grade schools, after which come elementary, lower middle, upper middle, and junior secondary schools, working finally up to Makerere college. Elementary schools are controlled and financed by district boards, assisted by native administration funds and in some cases by Government grants. Makerere college approximates to an East African Native University college. In Sept. 1937, a commission on the problem of education recommended the establishment of primary schools by the native administrations.

**Trade and Communications.**—Cotton is the chief agricultural product, the estimated export in 1936 being 330,000 bales. There is indication of the existence of rich minerals, and the export of tin in 1936 was 575 long tons. Uganda is linked in customs union with Kenya and Tanganyika; 1936 exports of the three territories were valued at £8,354,774, and imports at £7,377,279. There are 2,048½ miles of main roads maintained by Government, and c. 4,800 miles maintained by native administration. Roads are exceptionally good. The Cape-to-Cairo air service operates twice weekly from Entebbe. A new airport at Kampala was opened in July 1937. There are 330 route miles of railways under the Kenya and Uganda railways and Harbours Administration. The currency unit is the shilling, with subsidiary 50 cent silver coins and 10, 5, and 1 cent bronze. Revenue and expenditure for 1936 were £1,712,940 and £1,624,073 respectively.

**Ukrainians,** the most numerous of the Slavonic peoples, after the Great Russians, and one of the largest of all European peoples; easily the largest European people no part of which today enjoys complete national independence.

The chief home of the Ukrainians is the country north of the Black sea, where they inhabit a territory stretching from the Carpathians to the Don and beyond. This was the mediaeval Russian land, and received the name of "Ukraine" (= "frontier") only when the centre of the Russian power and population shifted northward under Tatar, etc., attacks.

Then, too, Moscow began to claim to represent the true Russian stock, of which, it alleged, the Ukrainians or "Little Russians" were only a sub-branch. This brought about among the Ukrainians a counter-claim of a separate national identity and a movement towards national independence. The ideal of national unity was weakened by the fact that a large portion of the nation had come under Polish (later Austrian) sovereignty; had been absorbed by the "Uniate" churches (Eastern churches in communion with Rome); and had half-evolved a separate "Ruthene" nationality.

Today the Ukrainians of Europe live under four governments: in the U.S.S.R. (nearly 35 millions, chiefly in the Ukrainian Soviet Socialist Republic); in Poland (five to six millions); in the autonomous territory of Carpatho-Ruthenia, within Czechoslovakia (about 500,000); and in Rumania (about 500,000-600,000). There are also many emigrants in the U.S.A. and western Canada. Historical, religious, and political differences still divide the different branches of the nation, and in the peasant masses national feeling is still largely dormant; but in the future, the Ukrainian question will undoubtedly become a problem of the first magnitude. (C. A. M.)

**Ulster:** see GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF; IRELAND, NORTHERN.

**Unemployment** decreased substantially during the first three quarters of 1937 in the 28 nations for which statistics were available. Some countries emerged from the unemployment morass in which all were entangled during the early '30s; others reduced unemployment to a point where it was not serious. France, Denmark, the Netherlands, Austria, Great Britain, Poland, Canada, and the United States still faced troublesome unemployment situations, and the United States plunged into a business recession during the fall of 1937 which displaced more than a million people from their jobs before December 31.

The unemployment statistics of many nations are distinctly unsatisfactory and conclusions drawn from them are open to suspicion. The available figures are of two principal kinds, each gathered in several different ways; statistics of employment, i.e. of the number of people at work, and statistics of the number of people

FACTORY EMPLOYMENT AND PAYROLLS in the United States, by months, 1932 (....) and 1937 (—): Department of Labor indexes (average 1923-25=100)

in need of work. Employment statistics are derived from "establishment" reports collected by mail or through field agents or labour inspectors. Unemployment statistics are furnished by the employment exchanges (applications for work), unemployment insurance systems (applications for benefits), unemployment relief records, reports of trade union secretaries, and censuses of unemployment.

The various types of statistics agree reasonably well in their picture of what happened in the different countries during 1937, but not always upon the extent of the changes which occurred. In France and Canada, for instance, the employers' reports indicate more improvement in employment during 1937 than do the labour exchange figures, but in Czechoslovakia the labour exchange figures suggest more improvement in the employment situation than the establishment reports.

Great Britain and Northern Ireland started 1937 with fully three-fourths of their wage earners (nearly 13,000,000) under unemployment insurance. Of these, 1,676,966 were out of work in January, 1937. By June the number idle had decreased 291,334 to 1,385,632. Small reductions each month brought the unemployed down to 1,333,278 by September, with a typical seasonal increase of 61,128 in October. British unemployment during 1937 showed steady improvement over 1936 during the ten months for which figures were available. Starting in January with 11.2% of the insured population idle (1936 annual average was 11.3%), the unemployment percentage dropped to 8.7% in June and fluctuated between 8.5% and 8.9% from June through October. In 1929 8.2% (on the average) were totally unemployed and 2.2% on temporary layoffs. The first ten months of 1937 approximated the 1929 situation; and were in sharp contrast to the high figures of 1930-35. If the 4,750,000 not covered by the insurance act were included in the figures, the unemployment percentage would be more apt to fall than to increase, since military service, the police, civil service, teaching and other relatively stable occupations were in this group.

Registrations of unemployed persons at the employment offices of the Irish Free State increased five-fold from the pre-depression years to 1935. Moderate declines in unemployment in 1936 were followed by a sharp decline in 1937. During the summer and fall of 1937 unemployment appears to have been three times pre-depression levels and about 60% of 1936.

France and the Netherlands had similar records in 1937. Both experienced unusually severe unemployment in 1937. French unemployment reached its peak in 1935-36. The decline during 1937 (labour exchange registrations) was small. Approximately 340,000 of the 475,000 idle in 1936 were still idle in the summer of 1937. Employers' reports showed employment in the summer of 1937 at less than 80% of the 1930 level and man-hours worked at only two-thirds.

In the Netherlands unemployment reached its peak in 1935, when 36.3% of the workmen covered by unemployment insurance were idle (173,700). January 1937, found unemployment at these peak levels, improvement from which brought the unemployed percentage down to approximately 26% through the summer of 1937—ranging from 119,000 to 133,000 idle each month.

Belgium, in contrast, showed marked improvement in 1937. Substantial progress in re-employment in 1936 continued through the summer of 1937. The employment index approximated 90% (of 1929) during the first eight months of the year. Insured workers idle decreased from 14.5% in January to 9%, June-August. Days lost dropped from 3,881,345 in January to between 2,400,000 and 2,700,000, April-October. The number of unemployed was 163,039 in January; but 110,883 in August.

Denmark and Norway had a worse unemployment experience in 1937 than Sweden, judging from their statistics on trade union

unemployment (which are really inadequate to represent national situations). Denmark's percentage of trade unionists unemployed

was 21.1% through Aug., 1937 (1936=19.3%), Norway's through July, 20.0% (1936=18.8%), and Sweden's through August, 11.2% (1936=13.6). In the summer of 1937 the Swedish figures were moving to pre-depression levels, averaging 8%, but in Denmark the summer average was 14.7% and Norway 16.3%.

The German census of 1933 recorded 32,300,000 people in the employable population (including employers, farmers, etc.), of whom 5,900,000 were unemployed. The German sickness insurance figures report an average of 17,105,771 employed in 1936. Jan., 1937 showed 16,599,462, with an increase to 18,447,773 by April, 19,094,961 by July and 19,105,121 by September—a gain of 2,505,000 from January to September, a part of which was seasonal. The Federal Institution for Placement and Unemployment Insurance estimated that in 1936 the number of employees was 69.1% of the possible maximum: in the last quarter of 1936, 72.0%; in the first quarter of 1937, 74.3%; and in August, 76.6%. The low point of the depression was 41.9% in 1932. The average number of appli-

JOHN D. BIGGERS, prominent industrialist, who took the job but refused the salary for directing the special U. S. unemployment census, which indicated about 10,800,000 idle in November

cants at employment exchanges dropped from 2,052,483 in Jan. 1937 to 1,182,979 in April, the lowest figure since Sept. 1928. The decline continued until in Sept. the registrations were but 650,901.

Switzerland's employment exchange figures are unusually reliable measures of unemployment because both the relief act of 1919 and the unemployment insurance law require applicants to register at the employment exchanges. From 1927 to 1929, 2.2% of the employable population were wholly unemployed and 1.6% partially. For practical purposes, this is zero unemployment in any country. In 1929 an average of 8,131 applicants registered at the employment offices (out of about 2,000,000 employables). In Jan. 1937, the figure was 110,754. Month by month the registrations declined to a low of 49,244 in July; then increased gradually to 56,804 in October. The first ten months of 1937 witnessed a 50% decline in registrations for work, but there were still some 40,000 more workers idle than in 1929. The Swiss index of em-

ployment, based on establishment reports, rose from 72.2 in Jan. 1937 to 80.4 in Sept. (1929=100).

The Italian index of employment (1929=100) was down to 78.5 in 1932 and back to 94.9 in 1936. Jan.-March 1937 it was approximately 93, then rose to 106 by June. Taking into account the growth of population, these figures indicate employment in the reporting establishments approximated the 1929 level in the early summer of 1937.

Hungary's employment index and employment exchange registrations do not agree in their pictures of the Hungarian situation in 1937. The former showed employment in the reporting establishments to have approximated the 1929 level during the first half of 1937, even allowing for some growth of population. The latter reveal that there were two-thirds as many registered for work in 1937 as in 1932, when unemployment was at its worst.

Czechoslovakia and Yugoslavia both had a rapid improvement in employment in 1937. Starting 1937 at 75.1, the Czechoslovakian index climbed to 96.8 by June and remained approximately there through September, representing employment of approximately 2,400,000 people compared with 2,506,000 in 1929. Employment exchange registrations were, in 1933, 738,267, and 667,486 in Jan. 1937. After Feb., they declined rapidly to below 250,000, July-Oct. 1937, the lowest figure since 1930. In Jan. 1937, 12.9% of the insured workers drew unemployment insurance benefits; by August but 6.2%.

The beginning of 1937 found the employment index at approximately the 1929 level in Yugoslavia, but employment exchange registrations were high for such a situation. During the first eight months of 1937 employment improved steadily. By August some 115,000 more people were at work than the average for 1929 and the employment index reached 119.2 (1929=100).

The general trend of employment in the U.S., Canada and Mexico was upward during the first eight months of 1937. A sharp business recession in the U.S. displaced more than a million workers from their jobs between October 15 and the end of the year, and increased unemployment in the United States to more than 10,000,000, possibly above 11,000,000.

The United States took a special census of unemployment, Nov. 20, 1937, which recorded 7,822,912 as unemployed (2,001,877 of whom were employed on government relief work). This census was a voluntary report of individual citizens on forms left at all the homes by the postal service. Obviously many would neglect to send in the returns. Consequently sample tests were made on 1,455 mail routes to determine the margin of under-reporting. These tests indicated that a complete return might have shown as many as 10,800,000 idle on November 20. The true number was probably somewhere between the 7,822,000 reported and 11,000,-

000. To this must be added the late November and December layoffs, probably totalling more than 500,000. In the depths of the depression (1932-33) unemployment in the U.S. totalled from 13,500,000 to 14,500,000; the 1937 figure was discouragingly large when compared with the 1933 figure. Minimum unemployment for the U.S. would be about 2,000,000. The 1937 figures were increased, of course, by a growth of 5.7% in population in the U.S. between 1929 and 1936 coincident with a failure of the economic system to operate up to 1929 levels.

There were employed on Federal public works financed by other than "regular" appropriations, approximately 3,000,000 people in Jan. 1937, and the figure remained at this level through June, after which substantial reductions were made in relief employment, the figure dropping to 2,316,000 by September. Considering both emergency and regular public works, there was a shrinkage from January to September of 869,804 in the number of persons employed on Federal works designed principally to relieve unemployment. More than half of the increase in private employment in 1937 was counterbalanced during the summer by the layoffs from public works.

The American index of manufacturing employment was 8 points lower in Jan. 1937 than the 1929 average. By April it was but 2.6 points below 1929 and it remained substantially at that level through September. The October index was 100.5, the high point for the year. In November the index dropped 5.8 points, the biggest November decline since 1920. Up to November the 1937 indexes had been above the corresponding months of 1936, but in November the 1937 index fell to 94.7 (1936=96.9).

While employment exchange statistics are available for the U.S. the figures have been so profoundly influenced by relief, public works, and other governmental policies that they cannot be used without careful explanation of their gyrations.

Canadian unemployment is measured in three ways; by employment office registrations, trade union returns, and monthly reports of employers. The three types of statistics all reveal the same general facts for 1937. Registrations at the employment offices averaged over 90,000 in 1936 compared with 14,996 in 1929. In January and February 1937 there were over 99,000 registered and in March and April over 100,000. From May to September, the numbers fell each month to approximately 77,000 in August and September. The figures indicate a definite decline in unemployment in the summer of 1937, but continuation of a large volume of unemployment.

The reports of union secretaries showed that from January to April 1937 approximately 14% of their members were idle. From May onward the percentage dropped to 7.7% in August and September, the lowest unemployment figure for any summer subsequent to 1930.

The employer returns showed average employment down to 70.6 in 1933 (1929=100), and up to 87.3 in 1936. In 1937, the employment index climbed steadily from approximately 87 in the first four months to 95.9 in May; 103.4 in August and 105.5 in September. Taking growth of population into consideration, the summer of 1937 saw unemployment approximating 1929 conditions, so far as the reporting industries were concerned.

The only figures on unemployment in Mexico are "official estimates." The figure given for 1930 was 75,695; for 1932, 339,378; for 1936, 186,906; and for the first four months of 1937, 187,357.

Japan was one of the nations with high employment in 1937, a by-product, of course, of war. Their employment index (1929=100) was 115.8 in 1936. It started at 119.6 in Jan. 1937 and rose to 129.1 by June. The government's official estimates of unemployment in 1932 estimate that but 6.8% of their employable population were idle, a figure hard to reconcile with an employment index of 82 that year. For January 1937, their unem-

FACTORY EMPLOYMENT (....) and payrolls (—) in the United States: Department of Labor indexes

ployment estimate was 333,331 (4.2%) and it had declined to 289,450 (3.8%) by May. The 1937 estimate checks better with the employment index.

The Union of South Africa, in direct contrast with most of the world experienced a comparatively slight decline in employment between 1929 and 1932—about 13%, and by 1936 her employment index was 25% higher than in 1929. In Jan. 1937 the index stood at 128.6, and reached 133 by April. It was above 131 in both June and July.

New Zealand's are entirely employment exchange figures. They indicate a gradual improvement in employment after 1934, with 1937 distinctly better down to August than any year since 1933. The numbers registered ranged between 34,000 and 37,800, January to Aug. 1937, compared with over 50,000 in 1936 and higher figures in previous years.

The only unemployment figures for Australia are compiled from reports sent in by union secretaries—a not very satisfactory type of unemployment statistics. The Australian trade union returns show 31,000 or 7% of the union workers unemployed (monthly average) in 1927; a figure which grew steadily to 120,454 (29%) in 1932 and then gradually subsided to 53,992 (12.2%) in 1936. The figures ranged downward in 1937 from 44,004 (9.9%) in February, to 43,584 (9.7%) in May, and 41,640 (9.3%) in August—a distinct improvement over any year since 1927.

The employment exchange registrations in Chile jumped from an average of 29,345 in 1931 to 107,295 in 1932, and then gradually dropped to 30,055 in 1934. Since then, applications for work have decreased sharply. Registrations were only 10,672 per month in 1935, 6,474 in 1936, and between 3,900 and 2,500 during the first six months of 1937, reflecting a high degree of employment in 1937. (See also SOCIAL SECURITY; NATIONAL INSURANCE: *Unemployment Insurance*; SPECIAL AREAS; UNITED STATES: *Social Security*.) (D. D. L.)

**Unemployment Insurance:** see NATIONAL INSURANCE; RELIEF; SOCIAL SECURITY.

**Unemployment Relief:** see RELIEF.

**Unfederated Malay States,** area 24,728 sq.mi., population (1931) 1,600,895, is one of the three main subdivisions of British Malaya (see articles, STRAITS SETTLEMENTS and FEDERATED MALAY STATES). They consist of six States, of which five, Johore, Kedah, Perlis, Kelantan and Trengannu, are located on the mainland of the Malay peninsula, while the sixth, Brunei, is on the island of Borneo. They are ruled by native sultans who have entered into treaty relations with the British Crown under which British advisers are appointed to the rulers. A number of British officials are employed in the service of the various States. Johore and Kedah are the most developed of the Unfederated States. There are Japanese iron concessions in Johore, which is on the mainland, opposite Singapore, and in Trengannu. (W. H. CH.)

**Union of South Africa:** see SOUTH AFRICA, UNION OF.

## Union of Soviet Socialist Republics

is bounded N. by the Arctic ocean; E. by the Pacific ocean, S. by the Black sea, Turkey, Iran, the Caspian sea, Afghanistan, India, China, Mongolia, Manchoukuo, and Japan; W. by Finland, the Gulf of Finland, Estonia, Latvia, Poland, and Rumania. The capital is Moscow (*q.v.*), and the national flag has a red ground with the hammer and sickle in gold in the top left corner; above them a five-pointed star bordered in gold.

"VOTIN' right today, Ivan?" The privilege of suffrage and the secret ballot in Russia, as seen by Hutton in the *Philadelphia Inquirer*

Cities of over 500,000 inhabitants are: Moscow (1936) 3,567,900, Leningrad (1935) 2,739,800, Baku (1935) 670,000, Kiev (1935) 625,000, Kharkov (1935) 625,000, Tashkent (1935) 532,000, Gorky (formerly Nizhny Novgorod) (1935) 512,000, Odessa (1935) 509,000.

**Area and Population.**—Area: 21,514,000 sq.km.; population (1937): 180.7 millions (43% born after the revolution), of which 46.1 millions (25%) is urban and 134.6 millions rural. In 1926, Russians were about 53% of the population, Ukrainians 21.2%, White Russians 3.2%, Kazakhs 2.7%, Uzbeks 2.6%, Tartars 1.9%, Jews 1.7%, Georgians 1.2%. The social composition in 1937 was: workers and employees 34.7%, collectivized peasants and co-operative craftsmen 55.5%, individual peasants (other than Kulaks) and craftsmen 5.6%, other sections of population (students, army, pensioners, etc.) 4.2%. According to article 124 of the Constitution, freedom of religious worship and freedom of anti-religious propaganda are recognized for all citizens. In language, the population of the U.S.S.R. belongs to the following groups: Indo-Europeans, Caucasians, Semites, Finno-Ugrians, Samoyedes, Turks, Mongols, Tungus, Palaeoasiatics, and the Far Eastern civilized population (Chinese, Japanese, etc.). The press of the U.S.S.R. is published in 69 languages, books in 111. On the stage, 45 languages are used. According to article 121 of the Constitution, the citizens of the U.S.S.R. have the right to education. This right is ensured by universal compulsory elementary education, free of charge. The total number (1936-37) of kindergartens was 23,600, and of elementary and secondary schools 163,729. In 1935-36 there were 716 workers' faculties and 2,572 technical colleges; universities and higher schools totalled 700 in 1936-37, and during that period the total number of pupils of elementary schools was 10,970,000; of secondary schools 17,093,-

000; and of adult schools 8,944,000. There were 551,000 university students (including 443,500 with State grants).

**History.**—In the course of 1937, with very few exceptions (e.g. Voroshilov and Litvinov), nearly all the Peoples' Commissariats of the Union changed their chiefs through death, dismissal or imprisonment. In most cases their places have been taken by younger adherents of Stalin hitherto hardly known. On Aug. 22, a new All-Union Commissariat for machine building was created, and, on Dec. 30, beside the Defence Commissariat, a separate Commissariat for war and naval affairs was set up. The Permanent Economic Council, formed on Nov. 23, is to include among its activities the planning of national economy, and the consideration of questions connected with prices, labour, wages, etc.

**Constitution and Elections.**—The year 1936 ended with the adoption of a revised Constitution by the Eighth Extraordinary All-Union Congress of Soviets in Moscow on Dec. 5, a day which has been declared a public holiday in the Soviet Union. According to the new Constitution, the Soviet Union as a federal State includes 11 (formerly 7) Union Republics: the R.S.F.S.R., the Ukrainian S.S.R., White Russian S.S.R., Azerbaijan S.S.R., Georgian S.S.R., Armenian S.S.R., Turkmen S.S.R., Uzbek S.S.R., Tajik S.S.R., Kazakh S.S.R., Kirghiz S.S.R.—which in their turn are formed from autonomous republics and provinces, territories, regions, districts, etc. The highest organ of State power of the Union is the Supreme Council, with its Presidium and two chambers of equal standing elected by the people for four years—the Council of Union and the Council of Nationalities. Legislative power belongs exclusively to the Supreme Council, and to it is also accountable the Council of Peoples' Commissars, the highest executive and administrative organ of State power in the Union. It is the prerogative of the whole Union to conduct international relations, the support and changing of the Constitution, organization of the defence, and the direction of all armed forces, foreign trade, planning of national economy and of the unified State budget, administration of banks, of industrial and agricultural establishments and trading enterprises of All-Union importance, transport and communications, establishment of basic principles in the field of education, public health and labour legislation, the working out of criminal and civil codes, and the issuing of All-Union acts of amnesty. For the rest, the separate Union Republics are Sovereign. They have their own constitutions, Supreme Councils, and Councils of Peoples' Commissars, and retain according to Article 17 even the right of free withdrawal from the Union. The holders of local State power in the territories, autonomous provinces, districts, cities, and villages are the Soviets of Working Peoples' Deputies.

The new Constitution guarantees to Soviet citizens in the future freedom of speech, of the press, of meetings, of processions, the right to unite in public organizations, inviolability of person and homes, secrecy of correspondence, the right to work (with payment in accordance with quantity and quality), the right to rest (7-hour working day, annual holidays with pay), the right to material security in old age and to education, and the equality of all, independent of sex, nationality, and race. The right of citizens' personal property in savings, dwelling-house, household articles, etc., as well as the right to inherit such property, is expressly ensured. According to Article 7, every collective farm household shall have for personal use a plot of land attached to the house, and as personal property the subsidiary husbandry on the plot. A small-scale private enterprise of individual peasants and craftsmen based on personal labour is allowed, provided there is no exploitation of the labour of others (Art. 9).

In the first months of 1937, in all the Union Republics extraordinary Soviet Congresses took place, at which the separate Consti-

tutions of the Union Republics were adapted to the new All-Union Constitution. On March 14, thousands of previously disfranchised Soviet citizens were automatically re-established in their rights, and on July 9, the Central Executive Committee of the U.S.S.R. adopted the rules for elections to the Soviet Supreme Council, in consequence of which all Soviet citizens of 18 years and upwards, including the Red Army, and excluding insane persons, received the right, irrespective of sex, race, nationality, religion, and even social origin or past activity, to take part in the elections and to be themselves elected. The elections themselves were to be universal, equal, secret and direct. After the end of October, a flood of mass meetings took place in the towns and villages of the whole Soviet Union, at which the candidates for the Supreme Council were nominated. The leading personalities of the Union thereby claimed first honours. With the help of the whole apparatus of propaganda, the Moscow Government sought to ensure a 100% electorate, to show the "foreign Fascists and their agents that a united people stand behind the Red Army." And, in fact, 96.8% of the over 97½ million franchised persons voted on Dec. 12 in the elections for the Supreme Council, although no other possibility was given the voters but to vote for the unopposed official nominee presented for each single-member constituency. The total number of deputies elected was 1,143, including 855 communists and 184 women. Socially, the new Russian "Parliament" consists of 55% officials from party and government; 7½% from the ranks of the army and navy, 30½% workers and peasants, and 7% "Intelligentsia and Illustrious Citizens."

**Domestic Affairs and Legislation.**—On Feb. 27, the Central Committee of the Communist party decided on the immediate conduct of secret and direct re-election of party officials in all party organizations, and the liquidation of the former practice of "co-option." And at the beginning of March, in two speeches much commented upon, Stalin himself subjected the increasing bureaucratization of the party to a devastating criticism, and demanded from it a closer contact with the masses of the people. At the elections held by secret ballot in the following months, a large number (35 in Moscow) of former party secretaries lost their posts.

Another highly important feature in the internal political development of the Union, which in November solemnly celebrated the 20th anniversary of the Bolshevik Revolution, was the struggle, ruthlessly carried out in 1937, against all real or only possible opposition elements, and those suspected of sympathy

CRUDE PETROLEUM PRODUCED in U.S.S.R.

with Trotsky, in the party, administration, and army. The year began with a sensational trial against 17 leading Communists, including Pyatakov, former vice-commissar for heavy industry, Radek, the mouthpiece of the Kremlin in foreign affairs, and Sokolnikov, former ambassador to Great Britain, who, according to the indictment, had sought, on the instigation of Trotsky, to overthrow the Government, in order to re-establish capitalism in the U.S.S.R., and had promised to Germany and Japan, in exchange for their support, considerable territorial compensation (Ukraine, Amur Territory) as well as great economic privileges and concessions. In order to hasten the removal of the Soviet Government, these former Communist leaders were said to have followed a policy of espionage, wrecking, and terror. All the accused fully admitted their guilt and made exhaustive confessions. On Feb. 1, 13 of them—Pyatakov, Muralov, and others—were shot, the remaining four, including Radek and Sokolnikov, were sentenced to periods of imprisonment ranging from 8 to 10 years. On March 5, Bukharin, the former chief editor of the official *Izvestia*, and Rykov, former chairman of the All-Union Council of People's Commissars, were expelled from the party for counter-revolutionary activities. Great excitement was caused then by the arrest, at the beginning of April, of the all-powerful Yagoda, the General Commissar of State Security, on account of the "discovery of criminal activity." On May 31, Gamarnik, the "basest and most dangerous Trotskyist," the first vice-commissar for defence, took his own life, and—a great shock for public opinion abroad—Marshal Tukhachevsky, together with seven other highly placed men of the Red Army, after a four-day secret trial by court-martial, was condemned to death and shot on June 12, having been found guilty of betraying military secrets to Germany, undermining the power of the Red Army, and preparing a military defeat with a view to the partition of the U.S.S.R.

On Dec. 19, one week after the elections to the Supreme Council, the shooting of eight more highly placed Soviet officials, including Karakhan, former ambassador to Turkey, and Yenukidze, Stalin's one-time right-hand man and secretary of the Central Executive Committee of the Union, was announced. Also the religious revival several times mentioned in the Russian Press, called forth oppressive measures by the Government against the clergy. The purge against Trotskyists and the hunt for "enemies of the people and socialism," "traitors to the Fatherland," wreckers, agents of Fascism, and spies was not, however, confined to the above-mentioned cases, but was carried out systematically throughout the Union and operated in all departments of public, economic, and cultural life.

On Jan. 6, a census was taken which, however, in September was declared invalid "owing to the violation of the most elementary principles of statistics." A new census is to be taken in Jan. 1939. According to the declaration of the Government on April 28, the second Five-Year Plan was completed on April 1 well ahead of schedule with regard to the main branches of national economy, and on the same day a decree was published reducing retail prices of different goods from 5 to 16%. According to the economic plan for 1938 announced on Nov. 29, the value of the gross output of all industries is to be increased by 15.3% over 1937, while the production costs are to be reduced by 1.9 to 5.4%. On Nov. 2, the wages of the lower-paid categories of workers were increased to 115 roubles per month as a minimum for those working on a time basis, and 110 roubles per month for those on a piece-work basis.

In Feb. 1937, the Red Army received new field service regulations, and on May 16 military councils were placed at the head of each military area, as supreme representatives of military authority. These have to bear full responsibility for the political and moral conditions and mobilization efficiency of the military

units within the area. In summer, a new defence loan was floated for an amount of 4,000 million roubles, and within two months was heavily oversubscribed.

In the cultural realm, noteworthy events are the increase in teachers' salaries (January) and in student scholarships (November), the full re-introduction of scientific degrees and ranks (March), closing of all "model and experimental schools" (April), and the measures taken for improving the teaching of foreign languages (September).

Soviet aviation in 1937 can point to a number of spectacular successes, especially in the Arctic.

**Foreign Relations.**—In foreign policy, in spite of repeated rumours of isolation tendencies in the Kremlin, the Soviet Union in 1937 continued to co-operate with the League of Nations, the Disarmament Bureau, and capitalistic countries. The basic principles of Soviet foreign policy were formulated by Litvinov in a reply to the American Secretary of State, Mr. Cordell Hull, in August, as follows: the indivisibility of peace and collective security; the necessity of avoiding force in pursuit of national policy; the adjustment of international problems by peaceful negotiation; the faithful observance of international agreements; complete general disarmament, and the organization of a permanent peace conference. The Union has co-operated in the Spanish non-intervention committee, and took part in September in the anti-piracy conference at Nyon and in the Nine-Power Conference on the Far Eastern crisis in Brussels in November. Soviet foreign policy was further based on mutual assistance pacts with France and Czechoslovakia. Relations with the other members of the Little Entente have not, however, improved appreciably. Yugoslavia continued to refuse recognition of the Soviet Government, and the Soviet Union could not see its way to recognize the incorporation of Bessarabia into Rumania. Relations with Germany and Japan, who in Nov. 1936 signed an anti-communist pact, have continued to be very tense. The long-established air-line connecting Moscow with Berlin was in the summer finally suspended. It also proved impossible to settle the questions outstanding between Japan and the Soviet Union, such as the revision of fisheries treaty, demarcation of the Siberian-Manchoukuo frontier, conclusion of a non-aggression pact, etc. At the end of Dec. 1937, the old Fisheries Convention of 1928 was extended for one year only. The relations of Moscow with Italy also had in 1937 some tense moments. The Soviet Government's making Italy responsible for the sinking of Soviet merchant ships in the Mediterranean in September, and the adherence of Mussolini to the German-Japanese anti-communist block in November, led to an exchange of sharp notes with Rome, though not to the breaking off of diplomatic relations.

Relations with Great Britain remained thoroughly friendly. On July 17, the U.S.S.R. signed a bilateral naval agreement with Great Britain; and only reserved special rights with regard to her Far Eastern fleet. In the middle of November, it was stated in the House of Commons that the whole financial credit of £10 million granted to the U.S.S.R. by the British Government in July 1936 had been utilized for purchasing British goods. On Aug. 4, after long negotiations, an important new trade agreement was concluded with the U.S., by which the Soviet Union, in exchange for the granting of unconditional most-favoured nation treatment, pledged itself to purchase during the next 12 months American goods to the value of at least \$40,000,000. On July 29, a U.S. warship visited a Russian port, Vladivostok, for the first time since the revolution. On Aug. 21, China and the U.S.S.R. signed a 5-year treaty of non-aggression, in which both pledged themselves "to refrain from any attack upon each other, whether singly or in conjunction with one or several other Powers." The reported cooling in relations between Turkey and the

Soviets was contradicted by the visits to Moscow in July of the Turkish ministers of the interior and foreign affairs. The signing of a new trade agreement with Turkey followed on Oct. 8. Russia was specially active in 1937 in her policy with regard to the Baltic countries. Courtesy visits of the foreign ministers of Finland, Latvia, and Sweden to Moscow made it possible to establish relations with these countries on a firmer foundation.

In the Spanish question the Soviet Government, both at the non-intervention committee in London and at the League Assembly in Geneva, sought by all diplomatic means—although not always with success—to uphold the rights and interests of the Republican Government of Spain. On Jan. 22, the U.S.S.R. agreed to the decision of the non-intervention committee prohibiting the enlistment, departure, and transit of volunteers to Spain. At the anti-piracy conference in Nyon in September the patrol of the Black sea was entrusted to the Soviet Government. And on Nov. 16, the U.S.S.R. accepted with great reluctance the proposal for granting belligerent rights to both sides in Spain after "substantial" progress in the withdrawal of foreign troops. Many thousands of Spanish refugee children have been received in the U.S.S.R.

**Trade and Communications.—Agriculture.**—Figures published in May 1937 showed that there are 1,627,367 sq.mi. of agricultural land, of which 1,431,635 sq.mi. belong to collective farms and individual peasant farmers and 195,732 sq.mi. to State farms. The sown area in 1937 was 522,000 square miles. Ninety-three per cent of the peasant households are collectivized. Preliminary returns for 1937 show the year's total output of land produce as 16.6 milliard roubles, and of animal produce 6.4 milliard roubles. Over 117 million tons of grain and over 21 million tons of sugar beet were produced. In 1936, the yield of raw cotton was 23,900,000 centners, and of flax 5,300,000 centners.

**Natural Resources.**—Approximate production figures: coal, 1,200,000 million tons; oil, 3,200 million tons; iron ore, 10,778 million tons; manganese ore, 709 million tons; copper, 17,073,000 tons; lead, 4,124,000 tons; zinc, 9,932,000 tons. 3,525,190 sq.mi. are under timber.

**Commerce and Industries.**—In 1936, the retail State trade was 80 milliard roubles; co-operative trade 26.9, and collective farms and peasant trade 15.6 milliard roubles. The turnover of foreign trade from Jan. to Sept. 1937 showed: exports, 1,218,549,000 roubles; imports, 1,012,761,000 roubles. Over 376 million roubles represent exports to Great Britain, and over 107 million roubles exports to the U.S. Further particulars relating to exports (Jan.-Sept. 1937) are: industrial goods 72%, agricultural 28%; timber 321,790,000 roubles, textiles 180,727,000 roubles; mineral fuels, 141,893,000 roubles; furs, 139,440,000 roubles; grain, 95,856,000 roubles. Nearly 92% of the imports were goods for industrial purposes, the principal imports being (Jan.-Sept. 1937, thousand roubles): machinery, equipment, and electrical materials, 280,574; non-ferrous metals, 205,877; textiles, 130,380; ferrous metals, 80,495. The principal sources of imports were (thousand roubles) U.S., 184,157; Germany, 180,318; Great Britain, 145,324. The value of orders placed by the Soviet Trading Organizations in Great Britain (Jan.-Oct. 1937) was £18,364,479. Principal exports from the United Kingdom to the U.S.S.R. were non-ferrous metals, rubber, machinery, and wool; and principal imports from the U.S.S.R. to the United Kingdom were gold, timber, furs, and grain.

Industrial output was as follows: (Jan.-Oct. 1937, thousand tons): coal, 100,880; steel, 14,680; pig-iron, 12,080; rolled metal, 10,720; (Jan.-Dec. 1936) oil, 29,293; electric power, 32,800 million kw. hours; gold (private estimate), 7,350,000 fine ounces. Light industries were represented by (1936 figures, in million metres): silk, 52; cotton, 3,299; wool, 98; linen, 286. From Jan.

to Nov. 15, 1937, 1,650,000 tons of fish and 1,190,000 tons of sugar were produced. The value of the industrial output for the first half of the year (at prices 1926-27) was, in million roubles: heavy industry, 17,917; light industry, 6,995; food, 5,207; timber, 1,457.

**Transport, etc.**—In 1937, there were 86,500km. of railway lines; and during 1936 the railways carried 991.6 millions of passengers and 483.2 million tons of freight. Ninety-five per cent of foreign trade was shipped by sea, and in 1936, 28,646,900 tons of cargo and 2,791,000 passengers were carried in 1,467 chartered foreign ships. Several powerful new ice-breakers were launched at the Leningrad shipyards in 1937. The length of river routes in 1937 was 110,000km., and the Moscow-Volga canal was opened during the year. (The White Sea-Baltic canal was opened in 1933.) Between 1931 and 1935, 185,000km. of new roads were built; and there are at present under construction a 16-metre wide road from Moscow to Kiev (866km.), and one from Moscow to Minsk (655km.). The number of motor vehicles in 1937 was 585,000. There are 54,000km. of air lines, carrying (Jan.-Sept. 1937) 20,838 tons of freight, 3,753 tons of postal packets, and 123,793 passengers. Moscow is connected by air with the following: Vladivostok, Tbilisi (Tiflis), Tashkent, Riga and Stockholm, and Kiev and Prague. There were, in 1936, 71 radio stations. In 1937, three new automatic telephone exchanges were installed in Moscow and one in Leningrad, and further exchanges are under construction in 47 cities.

**Finance and Banking.**—The currency units are the rouble, and the chervonetz of 10 roubles; the exchange value of £1 sterling in 1937 was 26.25 roubles. On Jan. 1, 1937, banknotes issued for circulation were to the value of 802,032,172 chervontzy; treasury notes 2,800,400,000 roubles. The gold reserve was estimated at the end of 1936 at about £236 million. Budget estimates for 1937 were: total revenue 98,069,500 thousand roubles; total expenditure 97,119,500 thousand roubles, of which approximately 27% is apportioned for culture and social purposes, and 20% for defence. Taxation estimates for 1937 (in thousand roubles): turnover tax, 76,795,400; profit tax, 6,304,175; income tax and other taxes from enterprises and organizations, 972,905; agricultural tax from collective farmers and individual peasant households, 650,000. According to Article 14 of the Constitution, the administration of banks comes under the jurisdiction of the U.S.S.R.

**Main Soviet Banks:** the State bank of the U.S.S.R. and its branches; Long Term Credit bank for industry and electrification (Prombank), the All-Union Trade bank (Vsetorgbank); the Central Agricultural bank (Selkhozbank); the Central Municipal and Housing bank (Tsekombank). In savings banks were deposits (1936) of over 4,000 million roubles. Statistical research work is concentrated in the Central Bureau of National Economy Accounting (Tsunkhu) of the All-Union State Planning Commission (Gosplan), which gets regular reports from each administrative, industrial, and agricultural body and from all other bodies and organizations.

**Defence Forces.**—Universal military service lasts 2-4 years. The conscription age is 19 years by January of the conscription year. There are eleven military areas. In 1936 the numerical strength of all services was 1,300,000. There were 13 military academies (16,000 students), and 6 military colleges attached to universities. There are Baltic, Black sea, Northern, and Pacific fleets. No accurate statistics are available. The *League of Nations Armaments Year Book* for 1937 gives the following data for 1936 taken from unofficial publications: 4 battleships (93,786 tons); 7 cruisers (49,854 tons); 32 destroyers (34,793 tons). A new 3,500-ton destroyer, "Tashkent," built in Italy, was launched on Nov. 21 at Leghorn. The number of submarines is estimated

variously from 38 to 175. Of the infantry units of the army, 77% were in 1936 regular divisions, and 23% territorial divisions. There were also mechanized units and cavalry units. No official figures are published for the air force. Private estimates vary between 4½ and 5½ thousand military planes (including bombers, fighters, reconnaissance crafts, etc.). The Worker's and Peasant's Militia numbered 110,000 men in 1933; special troops of the People's Commissariat for Internal Affairs 45,390; escort guards 13,200; and customs guards, 1,800. (See also ARMIES OF THE WORLD; INTERNATIONAL LAW: *Private Property*; WATER POWER; WORLD ARMAMENTS.)

**BIBLIOGRAPHY.**—U.S.S.R. Handbook (London 1936); Mikhaylov, N., *Soviet Geography*, 2nd edition (London 1937); Webb, Sidney and Beatrice, *Soviet Communism—a new Civilization*, 2 vols., 2nd edition (London 1937); Maxwell, B., *The Soviet State—A study of Bolshevik rule* (London 1935); Hubbard, L. E., *Soviet Money and Finance* (London 1936). (S. YAK.)

**Unitarian Church.** A commission of appraisal, consisting of eight educational and religious experts, surveyed the Unitarian Church in America and their findings were published in 1936 under the title "Unitarians Face a New Age." In May, 1937, the chairman of the commission, Dr. Frederick May Eliot of St. Paul, Minn., was elected president of the American Unitarian Association, and re-organization of the denomination along various lines suggested has begun. Opponents of the recommendations of the commission attempted to fight the election on doctrinal grounds, raising the issue of theism vs. humanism. The genius of Unitarianism as a non-doctrinal, free religious organization, displayed itself by the almost unanimous refusal of both theists and humanists to recognize any such issue.

A new office of national significance was created, that of moderator, to preside at conferences and represent the denomination throughout the country. Hon. Sanford Bates, former commissioner of correction for the State of Massachusetts, and superintendent of Federal prisons, now president of Boys' Clubs of America, is the nominee for election in May, 1938.

The International Association for Liberal Christianity and Religious Freedom, which joins Unitarians and other liberals in all countries, met in conference in Oxford, England, in Aug. 1937. Twenty-two countries were represented through delegates. Dr. Louis C. Cornish of Boston, formerly president of the American Unitarian Association was elected president to succeed Dr. Alfred Hall of Sheffield, England. Regional conferences will be held hereafter in various parts of the world in the years intervening between the triennial meetings of the congress. (J. H. L.)

**United Church of Canada** entered the year 1937 confident in the ideal and purpose which over twelve years ago brought about the union in Canada of Methodist, Presbyterian and Congregational Churches. Among the important features in the life of the United Church during the year were the setting up of a strong commission to study the problem of the downtown city church, the first meeting of the Council of Theological Education to raise still higher the standard of theological colleges, the creation of an Economic and Social Research Commission, the visit of Rev. R. B. Cochrane, D.D., as fraternal delegate to the British Churches overseas, the attendance by royal request of the moderator, the Right Rev. Peter Bryce, D.D., at the Coronation, the opening up of mission fields in the new mining areas of Canada, the attendance of nine delegates at the Oxford and Edinburgh Conferences, and an arrangement with the Baptist denomination to use United Church Sunday School publications.

In addition to the missionary and maintenance givings during the year of over \$1,500,000, the United Church raised \$10,000

to aid famine-stricken areas in China and India. Over \$55,000 was subscribed to give special help to ministers stationed in the dried-out areas of Saskatchewan; 5,000 bales of clothing were sent to the West, and, in conjunction with other denominations, 830 carloads of fruit and vegetables were shipped to the same area.

In June the Pan-Presbyterian Council, of which the United Church is a constituent member, elected as its president for the next four years Rev. Robert Laird, D.D., treasurer of the United Church. After his election Dr. Laird left to visit the extensive foreign mission fields of the church in India, China, Korea and Japan. The United Church is also a constituent member of the Ecumenical Methodist Conference, holds the same relationship to the International Congregational Council and is an associate member of the Federal Council of the Churches of Christ in America. (G. A. SL.)

**United Kingdom:** see GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.

**United States.** The United States Bureau of the Census estimated the number of inhabitants on July 1, 1937 at 129,257,000. This marked an increase of 820,000 over July 1, 1936 and of 5,482,000 over the 1930 census. Population figures for individual States may be found in the accompanying table and in the separate State articles. See also the articles BIRTH STATISTICS; CHURCH MEMBERSHIP; DEATH STATISTICS; EDUCATION; ILLITERACY; INDIANS, AMERICAN; NEGROES (AMERICAN); POPULATION, MOVEMENTS OF AND UNIVERSITIES AND COLLEGES for statistical information of social conditions. (X.)

**History.**—The endorsement of the first Roosevelt administration by the people of the United States at the polls on Nov. 3, 1936, was emphatic. The president carried every State in the Union except Maine and Vermont against his Republican opponent, Governor Alfred M. Landon of Kansas, and received 523 of the 531 votes of the electoral college. Of the 45,514,968 voters who went to the polls (as against 39,763,589 in 1932) more than 27,000,000 cast their ballots for the Roosevelt electors. How far

COMPARATIVE CHART OF  
STATE POPULATION JULY 1, 1937  
AS ESTIMATED BY THE U.S. CENSUS BUREAU

\*FIGURES REPRESENT MILLIONS TOTAL POPULATION OF THE UNITED STATES INCLUDING THE DISTRICT OF COLUMBIA: 129,257,000

this decisive victory was due to the personal charm and persuasiveness of the president, and how far to sympathy with the fundamental policies of the New Deal would be difficult to say. William Allen White, the "sage" of the *Emporia Gazette*, whose mellowed wisdom is a proverbial asset of American political thought, gave perhaps the best summary of the significance of the election. It marked, he wrote, "a firm desire on the part of the American people to use the Government as an agency for human welfare . . . from this November day on we should have a new America, an America in which at least for four years the Federal Government should be the strong coercive arbiter between those who have and those who have not . . . we are walking down a strange highway, but we have deliberately chosen to go that path. Our eyes are wide open. We know what we need, and neither courts nor constitution nor ancient tradition can hold us here at the turn of the road. We are going on a great new adventure . . . as the old hymn lines it out, it is 'a grand and awful time.'"

The first session of the 75th Congress met on Jan. 5, 1937. The Senate contained scarcely a dozen determined opponents of the administration, for, in addition to the 76 Democratic members (some of whom had to find seats on the Republican side of the chamber), there were several nominal Republicans, like Norris of Nebraska, Nye of North Dakota and Johnson of California, who generally supported the measures of the New Deal. In the House the Democrats, with 334 seats out of 435, had the largest majority that any party had commanded since 1855. William Bankhead of Alabama was elected speaker of the House, with Samuel Rayburn of Tennessee as floor leader. Joseph T. Robinson of Arkansas continued as leader of the Senate till his death on July 14, when he was succeeded by Alben Barkley of Kentucky. What attitude the president, invested anew with a tremendous grant of power, would take toward the pressing problems of the day was a matter of considerable speculation. He had not always been consistent (and, indeed, had not claimed to be) in his policies, though holding firmly to his objectives. For example, in his last speech of the campaign of 1936 he had declared that he "had just begun to fight" for his comprehensive program of crop control, conservation, crop insurance, abolition of child labour, slum clearance, shorter hours and higher wages in industry, collective bargaining, cheaper electricity, social security, and a number of other measures. Yet he had intimated at times that the fight was well nigh won and that the protesting business interests might look forward to a "breathing spell." The annual message which the president read to the newly assembled Congress, however, left no doubt that he intended to go on with his fight for social justice. He dealt with a number of dangerous or deplorable conditions confronting the people, such as the lack of proper housing, the prevalence of farm tenancy, continued unemployment, the abuses of monopoly, inadequate wages, and the threat of foreign war; and declared that there must be a strong and alert government to cope with these problems. "The most far-reaching and most inclusive problem of all," he said, "is that of unemployment and the lack of economic balance, of which unemployment is at once the result and the symptom." While business recovery had mitigated the distressing situation of 1932 and 1933, still, with some 8,000,000 willing workers out of a job, the Government could not be justified in "placing the unemployment problem in a filing cabinet of unfinished business." Nearly half the American people were unable to maintain themselves in health and comfort because of inadequate incomes, while we had "ample resources in the country." The aim of Government should be so to distribute the product of industry that "all willing and competent persons will be able to live comfortably." A very large order!

**Congress.**—The results of the more than seven months of

PRESIDENT ROOSEVELT reviewing his second inaugural parade from an especially built stand that was a replica of Andrew Jackson's famous home, the "Hermitage"

debate in the Congress which sat from January 5 to August 21 were so disappointing as to elicit from many critics the reproach that it was a "do-nothing" Congress. The meagre accomplishments of the session were due partly to a split in the unwieldy Democratic majority between those who supported the president's go-ahead policy and those more conservative members who believed that the time had come to call a halt in the New Deal program; and partly to a bitter struggle over an unexpected bill which the president sent to Congress on February 5, calling for a drastic reorganization of the Supreme Court and the inferior Federal courts (*see SUPREME COURT OF THE UNITED STATES*). In spite of the fact, however, that the major proposals of the president were either defeated, like the Supreme Court bill; or ignored, like the plan for the reorganization of the executive departments, the establishment of six regional power systems on the model of the Tennessee valley authority, and legislation for crop control; or left hanging in the air, like the bill to regulate hours and wages, the confused and contentious session may be credited with some positive results. A Neutrality Act (*see*

DEATHS IN 1935 IN WHITE POPULATION OF U. S. A.: 1,207,359	LIVES SAVED BY IMPROVEMENT IN MORTALITY SINCE 1900: 768,402
--	---

IF THE MORTALITY RATE of 1900 had prevailed in 1935, there would have been 1,975,761 deaths (full length of bar) in the white population of the United States instead of 1,207,359. (Metropolitan Life Insurance Company: *Statistical Bulletin*, November 1937)

INCREASE IN AGE of the population of the United States in half a century

below, under *Foreign Affairs*), signed May 1, provided for the procedure and the machinery which it was hoped would keep the United States out of war. The Guffey-Vinson Coal Act, approved on April 26, replacing the Guffey Coal Control Act which had been declared invalid by the Supreme Court a year before on account of its wage clauses, regulated the production of bituminous coal entering into interstate commerce; thus salvaging to a great degree the principle of the "little NRA." A beginning at least was made

HENRY MORGENTHAU, JR., U. S. Secretary of the Treasury

in the relief of the farmer tenants (who comprise more than 40% of the farmers of the country) by the passage and approval in July of the (Bankhead) Farm Tenancy Act, which provides for a Federal loan of \$10,000,000 for the first year, \$25,000,000 for the second, and \$50,000,000 for each succeeding year, to enable farmers to buy their land. The loans are to be administered through the Farmers' Home Corporation (superseding the Tugwell Resettlement Administration) and are to run for 40 years with interest at 3%. At the same time Congress overrode the president's veto of an act extending the  $3\frac{1}{2}$  and 4% interest rate on the old loans of the Federal land banks. It is true that the relatively small appropriations of the Farm Tenancy Act will make it possible for only a very tiny percent of the 3,000,000 tenants in the country to buy their own farms; but it is at least a gesture in the right direction.

Another important relief measure which occupied the attention of Congress was Federal aid in providing decent homes for the 75% of American families whose income is less than \$2,000 a year (see HOUSING). Due to the depression and to the high prices of material and labour that followed, there was an alarming shortage of houses and apartments for rental at the cost of not more than \$6 a month, and a consequent alarming growth of the slum population, with all the evil effects of the same on the health and morals of the community. Bills sponsored by Senator Wagner of New York and Representative Steagall of Alabama resulted in the Housing Authority Act (signed by the president on September 2), by which the Federal Government was empowered to loan to States, counties, or cities \$100,000,000 the first year and \$200,000,000 in each of the two following years for the construction of low-rent houses and apartments. Cash subsidies, limited to \$20,000,000 a year, were to be granted to the owners of such buildings to compensate them for losses on the low rentals; but the grants were available only in case the new building replaced a slum dwelling. It was realized that the Housing Act would not provide for more than about 350,000 units in three years, whereas millions of low-rent homes were needed. The president, in fact, in a special message to the extra session of Congress (November 29), called for a \$16,000,000,000 drive by private interests to build the 3,000,000 low-rental houses needed to bring our living standards up to the level of 1930; and at the same time suggested changes in the Housing Act for the reduction of interest rates on the F.H.A. loans. New Wagner-Steagall housing bills were passed by both Houses in December, just before the adjournment of the

extra session, and, as the year closed they were awaiting final formulation by a conference committee.

In addition to the measures noted above, the first session of the 75th Congress made provision for the continuance of the C.C.C., and the reciprocity pacts negotiated by Secretary Hull, and appropriated the \$1,500,000,000 asked for by the president for relief. A Railroad Retirement Act extended the social security system to about 1,500,000 railway employees. A Sugar Act empowered the secretary of agriculture to limit imports of sugar from foreign countries and from Hawaii and Porto Rico. And beneficent reforms were made in the Federal courts to expedite procedure and to curb the issue of injunctions. (See also CONGRESSIONAL LEGISLATION.)

**Recession, 1937.**—The failure of Congress to legislate on crop control in wheat, cotton, corn, tobacco and rice, to tackle the problem of the revision of the anti-trust laws, to provide for the reorganization of the executive department, to set up six new regional planning systems like the T.V.A., or to produce a wages and hours bill for industry, led the president to call an extra session of Congress on November 15. In the interval between the two sessions a severe "recession," which seemed to many to presage a major depression, had set in. Business activity declined from a high index number of 111.2 on August 14 to 88.9 on November 20. Steel production fell from over 80 to 31. The stock market entered on a tail-spin which sent the average of 50 issues down from 135.5 to 82. In every branch of heavy industry there was more or less stagnation, in the face of urgent need for expansion. The \$12,000,000,000 utilities interests, for example, required an expenditure of more than \$1,000,000,000 for construction work in 1938 (see PUBLIC UTILITIES). The President, in his message of November 15, spoke of the "marked recession in industrial production and purchases," and asked the co-operation of business "not only to produce goods for the nation's market but to furnish markets for the nation's goods." Concentration on the President's program for the extra session, however, was largely thwarted by the bitter controversy which arose over the causes and the cure of the recession. On the one hand, it was urged that the rapidly sinking curve of production and capital values was due to the fear injected into business by unsound taxes, such as those on undistributed corporation earnings and on capital gains, and by excessive government regulation. The champions of the administration, on the other hand, charged the "economic royalists" with staging a deliberate sit-down strike in order to discredit President Roosevelt and of "raiding" the stock market for political ends. The way out of the recession, said some, was to support the president as heartily as he had been supported in 1933; while others maintained that deliverance could come only from stern resistance to further Federal regulation of business. With this wrangling over basic policies and with a futile filibuster over the Wagner Anti-Lynching Bill stirring sectional discord in the Senate, it is little wonder that the extra session got off to a bad start. The results of its five weeks deliberation were scanty. Although farm bills were prepared and the new Wagner-Steagall bills passed in both Houses, and although some progress was made in recasting the Black-Connery Wages and Hours Bill (which had passed the Senate in the summer of 1937), no progress was made in the other items of the President's program and no major bill was ready for his signature. It was questionable whether the results of the extra session justified the \$220,000 which it cost the taxpayers for mileage allowance.

The most obvious fact of the economic history of the United States in the year 1937 was the contrast between the rising curve of prosperity in the first half of the year and the steady recession in industry, capital values, and stock market prices which characterized the second half. Not that there was any such sud-

den plunge into the abyss of depression as occurred in 1929, when, as a result of the unhealthy "boom" conditions of the Coolidge era, there was a surplus of production of durable goods, an excess of corporation borrowing, wild speculation in the stock market, an alarming increase in bank failures, a demoralization of world trade, and a persistent depression of farm prices which made it impossible for the farmer to meet his taxes and interest charges and have any dollars left to purchase the goods turned out by industry. These evils had been remedied to a great extent since 1933. In 1937 there was a shortage in housing and industrial equipment, with ample capital waiting for investment. The banks were in sound condition (*see* BANKING). Many abuses in the stock market had been eliminated by the Security Exchange Act (*see* STOCK EXCHANGES), and the investing public, somewhat sobered by their losses in the great crash of 1929, were more wary both of the kind of securities they bought and of the method of trading on margins. Farm income had doubled in the period 1932-37, reaching a total of about \$8,500,000,000 in the latter year, thanks to the benefits distributed to the farmers under the A.A.A. and the Soil Conservation Act; so that, in spite of further needed farm legislation (being worked out in Congress in early 1938), the farmer has a fair "cushion" of funds with which to meet the present "recession."

By the midsummer of 1937 the economic balance-sheet presented an encouraging aspect. Taking as a base the figures of 1923-25 (quite prosperous years before the "boom") the production index of July, 1937, was 114. Two percent more people were employed, and the payrolls showed an increase of 1.2%. Although the cost of living rose about 4% in the 12 months previous to July 1937, it was still considerably lower than it had been a dozen years before, and wages had risen faster than living costs. Foreign trade, which had declined more than 50% in the depression years, was regaining its normal status, the volume of exports reaching the 1923-25 level and the imports showing an increase of about 13%. Steel production in the first quarter of 1937 ran nearly 600,000 tons ahead of the previous high record of 1929, and the U.S. Steel Corporation paid off the accumulated dividends of over \$18 a share on its preferred stock. The sale of electrical goods reached \$2,400,000,000, a 15% advance on 1936. The total dividend disbursement in 1937 was \$4,550,000,000, the largest since 1930. The national income, which had sunk below \$40,000,000,000 in 1932, had risen to nearly \$70,000,000,000, and President Roosevelt in his message to Congress in January, 1938,

spoke confidently of raising it up to or above the figure of \$90,000,000,000 attained before the depression.

With all these signs of business prosperity at the mid-year, the slump of the autumn and early winter came as a storm out of a fairly clear sky. "There is no adequate justification," said Alfred P. Sloan of the General Motors in his New Year's statement, "for the situation in which we find ourselves." The explanation generally adopted by the big industrialists like Mr. Sloan is that the recession in business was due to political rather than to purely economic causes. Continued Federal expenditure for relief, public works, agricultural subsidies, housing projects, and so forth, in excess of the Government revenues had both resulted in national deficits for a number of years and tempted the Government to seek sources of revenue (like the capital gains tax and the undistributed profits tax) which were a burden upon business. Seven years of unbalanced budgets had raised the national debt from \$16,185,000,000 in 1930 to \$33,778,000,000 in 1936, and, in spite of attempts to pare the budget, another \$2,993,000,000 was added to the debt in the calendar year 1937. If Congress, in obedience to the president's demands, continued its "extravagance," confidence in the Government's ability to get out of the red might be destroyed and a period of inflation might set in which would ruin the creditor classes. President Roosevelt in his last three annual messages held out the hope that the budget would be balanced "next year"; but the increased treasury receipts never sufficed for the expenditures. And in Jan. 1938, the president spoke of a budget stabilized at about \$7,000,000,000—to balance which additional revenues of over \$1,000,000,000 will have to be found (*see* BUDGET). Aside from the uncertainty of the tax situation occasioned by the unbalanced budget, big business was apprehensive of the extent to which the Government might go in its policy of regulating wages and hours, of tightening the anti-trust laws, of entering into competition with private industry in the utilities field, or of supporting the aggressive tactics of organized labour and the rulings of the National Labor Relations Board.

How far such apprehensions are a justifiable and honest reason for the sudden slowdown of capital investment and the consequent industrial slump is hard to say. At any rate, the situation gave rise to a bitter controversy. At just the moment when the president was urging co-operation between industry and the Government and inviting representatives of big business to conferences at the White House, the "rugged individualists" on the one hand were laying the blame on the dogged folly of the administration, and responsible men in the administration, like Assistant Attorney-General Jackson and Secretary Ickes were accusing the industrial leaders (most of whom belong to the Republican party) of fostering a state of fear in the nation in order to create hostility to the administration—even as the Jacksonites a century ago charged Nicholas Biddle and Henry Clay with engineering a financial panic in order to dish the Democrats. A foreign comment on the eco-

U. S. NAVY GUNBOAT "PANAY" bombed and sunk in the Yangtze river near Nanking, China, by a Japanese Navy aeroplane

conomic recession of the latter part of 1937 was of interest. A cable from Paris, December 22, ran: "The American situation is not considered here as anything analogous to 1929. General opinion is that your depression is temporary . . . especially if Roosevelt refrains from all initiatives susceptible of augmenting the burden on business."

"Until now the American economic system has been stimulated by government spending. Henceforth American capital ought to feed business activity directly, instead of being used for subscription to Government loans."

**Labour.**—The contention of capital that the behaviour of organized labour was to a large degree responsible for the recession was based on serious warfare between capital and labour in the early months of the year. The Wagner National Labor Relations Act, passed in July, 1935, and upheld by a 5 to 4 decision of the Supreme Court on April 12, 1937, had created a board of five members to administer the act. In the 17 months up to the spring of 1937 the National Labor Relations Board handled more than 2,000 labour disputes, involving 750,000 workers, and settled 75% of the cases peaceably. But toward the close of 1936 two factors entered into the situation which greatly augmented the friction between labour and capital. First, the veritable flood of dividends disbursed by the corporations, as a result of the improved condition of business and of the desire of capital to escape the new taxes on undistributed profits, convinced labour that it was not getting its fair share of the fruits of reviving prosperity. And, second, a new type of labour union had appeared in the field, recalling some of the features of the "one big union" idea of the old Knights of Labor and the I.W.W. This was the Committee of Industrial Organization (the C.I.O.), started in November, 1935, by the dynamic John L. Lewis, president of the United Mine Workers. Both in structure and in spirit the C.I.O. differed from the long-established American Federation of Labor. It advocated the organization of all the workers, skilled and unskilled, in a given industry (the vertical plan) as against the more aristocratic, "horizontal", craft unions of skilled labour, which composed the A.F. of L.; and it approved drastic and direct action to bring pressure to bear on the employers, in place of the conciliatory conference methods of the older organization. There

had been a clash between the A.F. of L. and the C.I.O. in 1936, when ten unions had been suspended from membership in the Federation for adopting the C.I.O. organization. But it was not till after the re-election of President Roosevelt, to which Mr. Lewis' union had contributed a large sum in the lively hope of favours to come, that the C.I.O. moved simultaneously to its attack on big business (especially the steel and automobile industries) and on the A.F. of L. As its most effective weapon it adopted (from France) the "sit-down" strike, first applied when 1,000 workers in the Bendix Products Company of South Bend, Ind., quit work on Nov. 17, 1936, but refused to quit the factory to let other workers, strike-breakers or scabs, take their place. The next month the workers in the Midlands Steel Products mill at Detroit followed suit, and a wave of sit-down strikes swept over the country (*see STRIKES AND LOCK-OUTS*). In the first week of 1937 there were more than 100 strikes in progress. For the most part the sit-down strikes were conducted without violence, the political authorities, like Governor Murphy of Michigan refusing to precipitate a conflict by calling on the militia to evict the strikers, and the latter making a kind of picnic out of their encampment on the employers' property, as they waved to their families from the windows and drew up the baskets of food which their wives and children brought. But occasionally there was serious rioting and even bloodshed. For example, at the Republic Steel Works near Chicago, fighting on May 30 resulted in the death of ten strikers and the injury of 100 strikers and 28 policemen. The C.I.O., in spite of the fact that it was obviously using force to drive the workers into its unions, grew by leaps and bounds, until it claimed by midsummer to have drawn away a full half of the membership of the A.F. of L. Realizing that the split between the two great labour organizations was hurting the cause, their heads, William Green and John L. Lewis, met in a number of conferences from October to December to try to reach a working agreement. But as each side was adamant in its demand to represent the labour movement and to reduce the other side to a position of tolerated, if not obedient, dissent, nothing came of the conferences.

Aside from the purely economic struggle of labour with capital and the Green-Lewis fight within the ranks of organized labour itself, which are treated elsewhere in this volume (*see LABOUR UNIONS and LABOUR ARBITRATION*), the politico-legal aspect of the labour question assumed unusual importance in the year 1937. What was the proper attitude for the political authorities, from the president down to the mayors and the sheriffs, to take in the struggle? Were the sit-down strikers guilty of trespass in occupying the property of the employers after laying down their tools? Was the National Labor Relations Board a fair and efficient tribunal in the disputes between capital and labour? President Roosevelt, whose example naturally influenced the lesser officials, refused to intervene to bring the executives of the General Motors Company or the Republic Steel Company to an agreement with Mr. Lewis, as Theodore Roosevelt had intervened to call a conference between the coal operators and Mr. Lewis' predecessor as president of the United Mine Workers, John Mitchell. Nominally impartial, the president leaned to the side of labour, characterizing as "unfortunate" the reply of Alfred P. Sloan of General Motors to the demands of Lewis, and having "a pleasant talk" with the latter, his good friend, at the White House, on September 15. Indeed, Mr. Lewis went so far as to remind the president that he owed his election to labour (an indefensible assertion) and to warn him that there would be a bolt from the Democratic party if he did not support the C.I.O. This was too much even from a good friend, and in his Labor Day address of September 4 (the day after the "warning") the president charged both sides with having committed mistakes and showed his annoyance at the long

BALANCE OF MIGRATION to and from the United States of America, 1928-1937. (Figures are for fiscal years ended June 30)

IS MASS PRODUCTION of apologies and regrets an "example of the industrialization of Japan"? asks Berryman in the *Washington Evening Star*

continued feud of Capulet capital and Montague labour by invoking "a plague on both your houses." As the recession grew worse in the autumn and early winter, the president adopted a more conciliatory attitude toward capital, calling several of the leaders of industry to the White House for consultation on the ways and means of halting the slump.

Secretary of Labor, Miss Perkins, at first seemed to favour the sit-down strike, declaring that its legality "had not yet been determined." But later she changed her view, perhaps in deference to public opinion, which, if we may trust the poll conducted by the magazine *Fortune*, condemned this policy of compulsion used by the C.I.O. Of the four classes of people polled: executives, salaried employes, factory workers, and the unemployed, the percentage of those who voted in favour of keeping the plant open for non-strikers was larger than that of those who voted that the plant should be closed. The opinion of the unemployed, who were looking for a job, may not be surprising, and, naturally, the executives and the salaried force would vote against the sit-down; but that 39.7% of the factory workers themselves pronounced in favour of keeping the plants open, as against 36.8% who voted for closing them, was highly significant. It meant, as *Fortune* commented, that "American labour attaches too much value to a job, and too little to a union, to be really ripe for strong and sustained union militancy." Even in the month of January, 1937, when the "militant" union policy of the C.I.O. was just getting under way, a poll of the American Institute of Public Opinion showed 53% in sympathy with the companies to 47% in favour of the strikers. In these figures, perhaps, we may see why the sit-down strikes, after some apparent success in the early spring, died down by summer, and the C.I.O. became more amenable to the conference method of settling labour disputes. It is significant that in the same poll taken by *Fortune*, executives and factory workers agreed by almost the same figures (48.6% and 48.3%) that the best way of settling such disputes was by a committee of employers and employees.

Less than one-half as large a vote was cast for intervention by the Federal Government.

In view of the absorbing interest in Federal mediation in labour troubles and the elaborate machinery set up for its use, and in view of Mr. Lewis' rather threatening gestures to coerce the administration into active support of the C.I.O., it is to be noted that only 28.2% of the factory workers who voted favoured Government intervention. Such intervention has been chiefly

exercised through the Wagner National Labor Relations Board (the N.L.R.B.), which, since its successful operations in the spring of 1937, has tended to become more itself a subject of controversy than a composer of controversies. Capital accuses the board of manifesting a strong C.I.O. bias, and labour complains that it exceeds its delegated power in interfering with wages and hours. Both sides have charged it with arbitrary and unfair rulings and both have attempted to dictate to the board as to how the elections were to be held for the determination of whether the workers should be organized under the A. F. of L. or the C.I.O. Typical of the activities of the N.L.R.B. was its indictment of the managers of the Ford motor plant at Buffalo, on December 23, for violation of the Wagner Act, and its order to the company to cease and desist from interference with the organization of the workers. The company filed a rejoinder, characterizing the charges as "absolutely untrue," and prepared to fight the case in court.

Altogether, the record of the year 1937 in labour relations was far from encouraging. In the first five months of the year more than 2,000 strikes (more than the total number in 1936) were recorded by the Bureau of Labor Statistics, involving 965,000 workers. The bitter quarrel between the C.I.O. and the A. F. of L. filled the entire year. The Black-Connery Labor Standards (wages and hours) bill proved to be a subject of controversy rather than a solution of the problem. Though passed by the Senate in mid-summer, it failed of approval in the House, and it was not until December that a petition signed by the necessary majority of 218 members was secured to compel the Rules Committee to bring the bill to the floor, where its fate still remains uncertain in January, 1938. It was hoped that the creation of the N.L.R.B. would do for industry what the Railway Labor Board of 1926 had done in averting a major strike on the railroads; but, as has been stated, the N.L.R.B. failed to satisfy either the employers or the workers. The lesson of 1937 would seem to be that less reliance should be placed on governmental machinery and more on the conference method in securing such measure of peace and harmony as is possible in the field of labour.

Turning to the subject of transportation, substantial progress was made by the railroads in 1937, though they had not yet recovered from the inroads made on their business by the competition of bus, truck and aeroplane. By improving the comforts of travel and the speed of their air-conditioned streamline trains, the roads attracted a monthly average of over 20,000,000 passengers, excluding commuters, in 1937; and with their light but strong steel cars and their Diesel-powered low-fuelled locomotives were able to carry passengers profitably at the rate of less than two cents a mile prescribed by the Interstate Commerce Commission. The report of the president's National Resources Committee, completed in July, stated that "the producer, the manufacturer, the merchant, the public utility, and the individual are getting a freight service (as well as a passenger service) measured in hours instead of days, and in days instead of weeks, even as compared with 15 or 20 years ago." Naturally, as the speed, the efficiency, the economy, and the comfort of railroad travel increase, the demand for railway service grows. And while buses and trucks may cut into the short-haul business of the railroads, and aeroplanes may transport more of the lighter and more valuable freight and the passengers who are willing to pay for very rapid transportation, there is little doubt that the vast railway system of the country, whose reproduction value was estimated by the Interstate Commerce Commission at the close of 1937 at \$26,238,857,000, will continue to be the main agency of continental travel and commerce. As stated above, the railroads have had no serious strikes since the operation of the Railway Labor Board of 1926. However, there was a constant pressure put upon them by the railroad brotherhoods for an increase in wages, and a counter

demand on the Interstate Commerce Commission by the roads for an increase of rates. On August 25 the refusal of the roads to grant a 20% rise in wages threatened a strike of 250,000 workers; but the Federal mediator at Chicago was able to avert a break. On October 22 the Interstate Commerce Commission granted a freight rate increase of \$47,500,000 to the class I roads, and the next month (November 29) hearings were begun before the Interstate Commerce Commission on an appeal of the railroads for a \$500,000,000 rise in freight rates to offset the improved equipment and the increased operating cost of the roads. The railroad managers also declared that the increase of rates asked for would enable them to spend \$900,000,000 on needed new equipment. Though granting an increase in passenger rates to the roads west of the Mississippi, the Interstate Commerce Commission, on December 10, declined to sanction a general rise; but a week later the commission relented enough to grant an increase in freight rates estimated to yield \$20,000,000 annually. Meanwhile the roads secured lower prices for coal and a pledge from Chairman Jesse Jones of the R.F.C. to loan them funds for their operating expenses. (See RAILROADS.)

**Merchant Marine.**—Considerable progress was made in 1937 in the development of a worthy merchant marine. Though the United States ranked only below Great Britain, Germany and Japan in the number of merchant ships, the great majority of the vessels were employed in coast-wise and inland waterways traffic. Only 374 merchant ships were in overseas trade. The reasons for this lag in merchant marine were: first, foreign countries could build ships at a cost of 30–40% less, and, second, the wages of American seamen, since the Furuseth Act of 1915, were much higher than those of foreign seamen. Government subsidies to shipping, therefore, were indispensable for the maintenance of an American merchant marine. The Merchant Marine Act of the summer of 1936 created a Maritime Commission, of which Joseph P. Kennedy, formerly chairman of the Securities Exchange Commission and later ambassador to Great Britain, was made chairman. On November 9, Mr. Kennedy made a special report to Congress, advising a liberal increase in shipping subsidies and aid in ship building up to \$250,000,000, to revive "a very sick industry," and on November 30 the indefatigable chairman summoned a delegation of over 20 merchants to Washington, to plan service on 23 basic overseas trade-routes. On October 22 the Commission contracted for the building of a \$15,750,000 ocean liner to replace the "Leviathan," which had been taken over from the Germans at the time of the war and which, after being tied up at her dock in Hoboken for several years, was sold (December 10) to British firms to be scrapped. The Maritime Commission also asked for loans to build flying boats and for Federal supervision of ocean air travel.

**Aviation.**—The record made in aviation during the year 1937, both in the Government service and in private passenger and commercial lines, was striking. According to the report of General Westover, chief of the U.S. air corps, more than 400 fighting planes of the last word in equipment, speed, and safety devices (such as the automatic landing control) were added to the army air force during the year, in the plan to bring the total number of army planes up to 2,320 by June 1940. The navy program, as outlined by Rear Admiral Cook, chief of the bureau of aeronautics, contemplated a force of some 2,000 combat and patrol planes by 1942. During the period from June 1936 to December 1937 over 600 transcontinental and overseas flights of from 2,000 to 3,000 mi. were made without loss of life. The U.S. naval air station at Pensacola, Fla., turned out 297 qualified aviators during the fiscal year of 1937. The investment in commercial aviation rose from \$30,000,000 in 1930 to \$100,000,000 in 1937, when there were 78 domestic routes covering 200,000 mi. a day and

served by 2,366 airports. Trans-Pacific mail and passenger service, which had been inaugurated in Nov. 1936, by simultaneous east and west flights of the Philippine Clipper and the China Clipper between California and Manila, was extended to Hong-kong on Dec. 1, 1937, and to New Zealand on December 26. Early in July Pan American and Imperial Airways began "path-finding" flights between Ireland and Newfoundland, with a view to organizing a trans-Atlantic service.

Unfortunately, the aviation record of the year was marred by several accidents resulting in the loss of over 40 lives. On July 2 the last radio messages from the South Pacific were received from the most famous woman aviator in America, Amelia Earhart, who with her pilot Fred Noonan was making a round-the-world flight. United States warships and planes searched the waters of the Pacific for ten days without finding a trace of the missing flyers. Eleven persons were drowned when a United Airlines plane fell into San Francisco bay on February 10. On October 18 the passengers and crew, numbering 19 in all, were killed when a magnificent airliner crashed into a peak of the Utah mountains east of Salt Lake City. But the worst air tragedy of the year occurred at Lakehurst, N. J., when the great German dirigible "Hindenburg" burst into flames just as she was approaching her mooring post in the early evening of May 6 and crashed to the ground carrying 36 persons to death in the burning wreckage.

**Social Security and Relief.**—When President Roosevelt signed the Social Security Act on Aug. 14, 1935, he declared that it was the most important measure of his administration. That act, still a subject for revision, extension, and lively discussion, was significant in that it marked for the first time the Federal Government's acknowledgment of a responsibility for the welfare of the aged, the crippled, the blind, dependent mothers and children, the jobless, and workers who worried over losing their jobs or over what would befall them when their days of usefulness were past. It was a complete reversal of the dictum of President Cleveland that it was the duty of the people to support the Government, but not of the Government to support the people. Except for certain direct grants to the blind, the crippled, and destitute mothers and children, the act made Federal aid contingent upon the legislation of the States, with the provision that such legislation must be approved by the National Social Security Board. To tide the workers over periods of sickness or forced unemployment, a tax of 1% for 1936, 2% for 1937, and 3% for each succeeding year was levied on the payrolls of every employer of more than 8 workers (except in agriculture, domestic service, and a few other exempt classes). In addition the act contained provisions for old age pensions for the needy and a scheme of old age insurance for workers generally. To the latter scheme both workers and employers were to contribute in equal shares: namely, 1% of the worker's wages for the years 1937–39, with a graduated increase up to 3% for the years 1949 and following. It was estimated that by 1980 the receipts from these assessments would reach the huge figure of \$47,000,000,000. Already by the end of Sept. 1937, the fund in the treasury amounted to \$448,500,000. During the first year of the operation of the Social Security Act 36 of the 48 States adopted the old age pension system, and a dozen States had passed laws enabling them to participate in the old age and unemployment insurance benefits. In the single month of Dec. 1936, no fewer than 19 States were added to the list, and the year 1937 saw the remaining 12 States and two territories within the jurisdiction covered by the Social Security Act pass legislation for unemployment compensation. Only Virginia at the close of the year remained without an old age insurance law. On May 27 the Supreme Court, by a vote of 5 to 4, upheld the unemployment insurance and old age pensions clauses of the Social Security Act. The Child Labor amendment

to the Constitution, which had been pending since 1924, was approved in 1937 by the legislatures of Kansas and Kentucky, bringing the total number of ratifications up to 28—only 8 short of the necessary three-fourths of the States. (See also SOCIAL SECURITY and RELIEF.)

The year also saw the first attempt of the Government to make an accurate census of the unemployed, when President Roosevelt on August 30 signed a bill for such a census to be taken through the post office machinery, and allotted \$5,000,000 of relief funds to administrator, John D. Biggers, for the job. The census, taken in November, registered 7,822,912 names, but Mr. Biggers believed that not more than 70% of the unemployed had actually registered, and he consequently estimated the number of idle at approximately 10,000,000, or about one-fifth of the nation's potential workers. That so large a proportion of the normally "gainfully employed" were still out of work was a sharp reminder that the problem of Federal relief was not, in the president's phrase, "to be placed in the filing case."

As has been stated, the president, by dint of insistent pressure, kept Congress from cutting down by a third his demand for a \$1,500,000,000 relief appropriation at the beginning of 1937. President Green of the A. F. of L., stating on April 11 that the unemployed numbered 9,700,000 (an estimate in close accord with Mr. Biggers' census of seven months later), declared that the Government must find work for at least 3,000,000 of the idle during the ensuing year, and held that the Government aid should be in the form of work on useful projects rather than on the relief-roll basis, "in order to avoid making permanent paupers out of millions of self-respecting Americans." The Department of Labor announced that 1,400,000 workers had been added to the pay rolls of private industry in 1936 and that W.P.A. jobs had been curtailed by Administrator Hopkins. But when the business recession of 1937 set in the W.P.A. workers waited on Mr. Hopkins and staged "job marches" to have their work restored. The President denied their plea for reinstatement (August 24), while granting that there should be an end of relief job cuts. However, on December 9, Administrator Hopkins announced an increase of 350,000 W.P.A. workers. The expenditures of the W.P.A. for the first 11 months of the year 1937 amounted to \$1,397,380,000. There was a great deal of criticism of the W.P.A. on the ground of excessive Federal spending, favoritism in the local allotments of projects, the futility of many of the projects supported, "dictatorial" power in the hands of Mr. Hopkins, and so forth. Mr. Abraham Epstein, Executive Secretary of the American Association for Social Security, repeatedly urged that the problem of relief should be intimately related to that of unemployment insurance, so that the needy unemployed should not be "shifted back and forth from the relief rolls." Since many now on relief are averse to accepting temporary jobs for fear that they will not be returned to the relief rolls when the job is over, Mr. Epstein ad-

MANUFACTURES IN THE UNITED STATES: number of factories with products valued at \$5,000 or more in the year (columns at bottom) and aggregate value of their products (line above)

vocated giving immediate and equal insurance benefits to all who are unable to find work "from the first day of their unemployment to the time they find a job." Thereby, he believed that slackers would be eliminated and the laziness and shiftlessness of uninterested workers on relief would be done away with. When granted on a dignified and secured basis, he said, relief can be as self-respecting as unemployment insurance. "Made work" is as likely to injure morale as is relief. "Handling a shovel or compiling meaningless statistics does not add to the dignity and morale of either the skilled worker or the technician."

**Crime.**—The year witnessed persistent and on the whole encouraging efforts to deal with an evil which has long been a source of indignant humiliation for every decent American. Murder, homicide, kidnapping, holdups, burglary, racketeering, and graft present the nation with a crime bill estimated at \$15,000,000,000 a year. The homicide rate is 20 times as high as that of Great Britain, and criminal law is so badly enforced that only a tiny percentage of the offenders are caught, convicted, and condignly punished. There are 3,500,000 known criminals at large in the United States (many of them thanks to the laxity of the parole system), and the chances are far more than even that every American citizen, at some time or other in his life, will become a victim to some form or other of organized crime. For the year 1937 J. Edgar Hoover, chief of the Federal Bureau of Investigation (the "G-men"), reported progress in ridding the country of gangster bands and capturing a number of desperate public enemies. Police training schools were increased and more than 90% of the criminals investigated by his bureau were convicted. Facilities for the detection of criminals were extended by the identification division of the Federal Bureau of Investigation, until it had nearly 8,000,000 finger print cards on file.

A scientific and humanitarian approach to the crime problem is tending to displace the purely punitive attitude. Recognizing how deeply the roots of crime are sunk in poverty, idleness, slum dwellings, and lack of education, public and private agencies were at work to improve the material and moral conditions under which the next generation will grow up. The provisions of the Social Security legislation and the housing program are cases in point. For example, in 1937 the Government completed the model co-operative town of Greenbelt, seven miles from Washington, which will house 885 families at rentals as low as \$18 a month. The project, which cost the Government \$14,000,000 and employed nearly 10,000 W.P.A. workers, is expected to yield \$425,000 a year in rents, of which \$60,000 will be profits. Since the

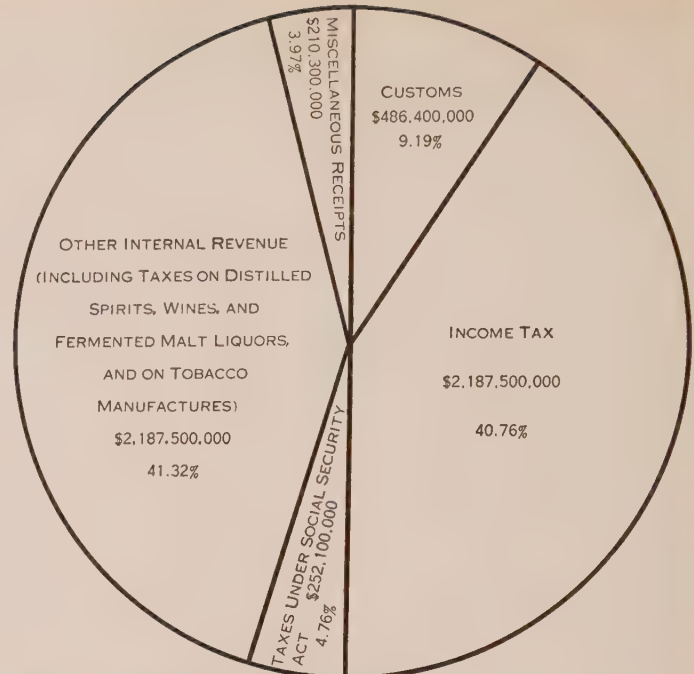

MANUFACTURING PRODUCTION in the United States; Federal Reserve Board index, without adjustment for seasonal variation

tenants will represent families in the income groups of \$1,000-\$2,000 a year, Greenbelt and similar projects will not take care of the slum dwellers; but such projects point the way to the cheaper mass construction of decent homes which promises, in conjunction with the drives for higher wages to the labouring class, to remedy the slum dangers of bad health and morals that contribute so heavily to the budget of crime in the United States. (See also CRIME and FEDERAL BUREAU OF INVESTIGATION.)

**Socialized Medicine** was a subject of much discussion during the year 1937. In April a pamphlet entitled *Doctors, Dollars, and Disease*, published by the Public Affairs Committee of Washington, brought a number of disturbing facts to the attention of the people. Americans were paying out more than \$350,000,000 a year for patent medicines of doubtful value, and another \$125,000,000 to quack doctors and fake healers. The high cost of proper medical care prevented the "middle-class" from getting its adequate share of attention, while the well to do and the poor (through charity) fared much better. For example, families with less than \$2,000 income averaged only two calls from physicians a year, as against five for families of the \$10,000 class and over. About half the doctors' fees were paid by 10% of the families. To span the gulf between the millions of people who are in sore need of medical care and the thousands of doctors who are available to render them service, a Government-sponsored health insurance program was discussed, a program somewhat similar to that which has been in efficient operation in Great Britain for a quarter of a century and under which all persons earning less than \$1,250 a year contribute a small amount (about ten cents a week) out of their wages, while the employers and the State make up the fund necessary to pay for medical care. More than 18,000,000 persons are thus insured, and are on the "lists" of some 16,000 physicians who volunteer to take insurance cases, which net them an average of \$2,250 a year. That there are many American doctors who would be glad to receive such an amount in addition to what their private practice brings goes without saying. Various forms of co-operative medical plans are already operating in local communities, in universities and colleges, and in industrial plants. Notable among these are the Ross-Loos clinic of Los Angeles which provides medical care by its staff of 25 doctors for a subscription of \$2 a month, and the Associated Hospital Service of New York city, to which about 250,000 members subscribe the \$10 annual fee entitling them to semi-private care, including board and nursing, for a period of three weeks in any one of 197 hospitals. The American Medical Association has generally been opposed to socialized medicine or compulsory health insurance for fear of the introduction of politics into the profession or the lowering of the fees (the doctors being actually at the head of the list in respect to average incomes in the country). But the trend of the whole economic set-up toward the relief of the underprivileged, added to the beginnings which the Government has already made for the care of the sick, the blind and the disabled in the Social Security legislation, seems to point inevitably to some system of public health insurance. Few people realize the extent to which the Government has broadened its responsibilities in this direction since Congress in 1798 inaugurated the U.S. Public Health Service by the founding of the Marine hospital to care for its sick and disabled sailors. Today the Government operates three-fourths of the tuberculosis hospitals, one-third of the general hospitals, and practically all the institutions for the insane in the country. In the control of milk and water supplies, the inspection of food, the examination of eyes, ears and teeth of school-children, the prevention of epidemics, the provision of parks, playgrounds, swimming pools, the public authorities are constantly widening their activities. The work of the Children's Bureau under the tireless management of Miss Katharine Lenroot

RECEIPTS OF THE FEDERAL GOVERNMENT in fiscal year ended June 30, 1937 (\$5,293,800,000) by source of revenue

has shown a remarkable record in cutting down the mortality rate of infants and mothers in cases of child-birth during the year. (See also SOCIALIZED MEDICINE.)

**Education.**—Scientific progress and the spread of free education, which are indispensable elements of social well-being in a democracy, have marked 1937. It would be impossible here to list the scientific achievements of the year, which the reader may find conveniently summarized in the *New York Times* of Jan. 2, 1938. But attention may be called to some important developments in the field of education. The public school enrolments in the elementary grades reached 23,000,000 and in the high schools 7,000,000, as against 15,000,000 and 500,000 respectively in the year 1900. At the earlier date \$215,000,000 was spent for education, a figure which has risen to nearly \$3,000,000,000. The growth of the junior college, to continue for two years the education of that large proportion of high school graduates who did not wish to, or could not afford the time and money to go on to a four years' college course, was rapid. In 1937 the 538 junior colleges, situated in all but three States of the Union, enrolled 130,000 students. But even more significant than the growth in numbers has been the emphasis upon a curriculum and a method of teaching aimed at producing a different type of student from the fact-stuffed, examination-worried boy and girl. Instead of the older routine which the weak toiled through in fear and the strong in rebellion, both hailing the end of the term as a day of deliverance from prison, the school now provides companionship, guidance, sympathy, and stimulus. The cultivation of a social conscience, rather than rivalry for individual success, is more and more emphasized as the purpose of education. One must acknowledge also the fine work done in the field of adult education by the W.P.A., whose educational division, operating in all the States of the Union, employs today 30,000 teachers of 1,250,000 students. The last census of the United States listed 4,500,000 illiterate adults in the country. This alarming number has already been reduced by 700,000 and the W.P.A. has set a tentative figure of 300,000 more for the coming year. In February 1937 the National Education Association passed a resolution commending the officials of the W.P.A. for "their foresight in recognizing adult education as an essential factor in national recovery . . . and for their efforts to

maintain high standards for the qualifications of teachers." And in March the superintendent of schools in Chicago declared that through the WPA program "those of us concerned with adult education as a function of Government have obtained a new vision." This work has not only been fruitful in itself in the past year but it has stimulated State departments of education, like those in Utah, North Carolina, Louisiana and Mississippi, to join efforts with the national organization in stamping out illiteracy.

Finally, there were incidents in the year 1937 which have appealed to the generous humanitarian spirit of the people of the United States. Early in the year terrible floods in the Ohio and Mississippi valleys rendered hundreds of thousands homeless and even threatened the destruction of great cities like Cincinnati and Louisville. Drought and dust storms followed soon after, with disastrous results to livestock and crops in the Middle West. Government agencies and private organizations, like the Red Cross, were quick to come to the relief of the suffering. The most pathetic tragedy of the year was the complete wreckage, on March 18, of a new school building at New London, Texas, through an explosion due to some defect in the gas-steam heating apparatus. Nearly 500 of the 740 pupils between the ages of 7 and 18 were buried beneath the ruins. Two flare-ups in race and sectional prejudice also occurred. The first came in August, when President Roosevelt chose Senator Hugo Black of Alabama to fill the vacancy on the Supreme Court caused by the resignation (June 2) of Justice Van Devanter (*see* BLACK, HUGO LA FAYETTE). The appointment of Black, an ardent New Dealer, was readily ratified by his fellow Senators; but it soon was revealed that Black had joined the Ku Klux Klan many years before, presumably to aid his political fortunes in Alabama. That he had not made this known when his name was under discussion led some of the Senators to protest that they would not have voted to confirm him had they known it, and many in the country to protest that he had obtained his high position through "fraud." On his return from Europe early in October he presented his *apologia* to the American people in a radio address, declaring that he had resigned from the Klan in 1922 and that he was opposed to all that it stood for. In spite of a fairly widespread demand that he should decline the appointment, and of petitions to the Court itself to declare him ineligible, Mr. Black was received by his fellow members when he took his seat at the opening of the December term, and the tempest in the tea-pot died down. The other disturbance was caused by the Wagner-Van Nuys anti-lynching bill, passed by the House on April 15, but held up in the Senate by a "filibuster" conducted by Bailey of North Carolina, Connally of Texas, and other Senators who denounced it as an insult to the South and a political manoeuvre to get the negro vote. The filibuster continued (to the detriment of important business) in the extra session of November 15, and was begun again in the regular session of 1938. (*See* LYNCHINGS.)

**Foreign Affairs.**—In the relations of the United States with foreign nations the most absorbing topic of the year was American neutrality: how can America keep out of war and at the same time not sacrifice "national honour," wreck foreign trade nor betray oft-repeated declaration of readiness to co-operate with other nations in securing a more stable and peaceful world. The failure of attempts to reconcile these conflicting purposes in the period of American "neutrality" under the leadership of Woodrow Wilson, added to the realization of the bitter fruits of the World War, the continuance of the mad race in armaments, and the actual military aggression of Italy in Ethiopia and Japan in China, stimulated the determination of Congress and the public to safeguard the neutrality of the United States. As early as August 1935, in view of Mussolini's attack on Ethiopia, a temporary neutrality act (to expire on Feb. 29, 1936) had been

passed, forbidding the exports of arms and ammunition to the belligerents and authorizing the President to close American ports to belligerent ships which would use them as a base and to proclaim that American citizens travelling in belligerent merchant vessels did so at their own risk. A supplementary act of Feb. 29, 1936, also temporary in character (to expire May 1, 1937) dealt with embargoes, absolute and conditional, again with reference especially to the Italo-Ethiopian conflict.

The definitive neutrality legislation, therefore, was postponed to the spring of 1937. But, meanwhile, Congress at the beginning of its session in January, extended the provisions of the act of 1936 to the factions which were waging civil war in Spain. Three conflicting policies were advocated for neutrality legislation: first, an "ironclad," mandatory law of Congress, prescribing exactly what the President must do in the event of the outbreak of a foreign war; second, a combination of mandatory and "permissive" provisions, prohibiting arms traffic but allowing the President considerable leeway in determining other embargoes and in regulating the travel of American citizens and the movement of American vessels; and third, leaving it wholly to the discretion of the President and the State department (as was U.S. traditional policy) to deal with threatening situations as they should arise. From bills sponsored by the chairmen of the committees dealing with foreign affairs in the Senate and the House (Key Pittman of Utah and Samuel D. McReynolds of Tennessee) the final compromise act emerged, and was signed rather reluctantly on May 1 by the President, who objected to the mandatory provisions. The act, in its most important clauses, provided: (1) that on the President's proclamation of the existence of a war between two or more nations (except those in North or South America) it should be prohibited to export arms or to make loans to any of the warring nations; (2) that the President may by proclamation forbid American citizens to travel on the ships of nations at war; (3) that he may, at his discretion, forbid American ships to carry goods purchased in the United States by belligerents and require that such belligerents pay cash for the goods before they leave (the famous "cash and carry," or "cash on the barrel-head," plan); (4) that only such credits may be given to nations at war as will enable them to carry on "normal peacetime commercial transactions"; (5) that armed merchantmen as well as war vessels of the belligerents should be excluded from American ports; and (6) that the President may place an embargo on "certain other articles" than arms and ammunition. This law, in spite of the objections of the White House and the State department, puts wide discretionary powers into the hands of the President, the chief of which is that his own proclamation of the existence of a foreign war (which technically is not going on today

in China, for example) is necessary to set the neutrality act in motion at all. As to whether any neutrality act short of complete isolation can avail to keep the United States out of war, opinion is very much divided. At any rate, complete isolation was repudiated by the president in his Chicago speech of October 5, when he declared that "the United States must play a part in the concerted effort to preserve international peace," and that when "innocent peoples and nations are being cruelly sacrificed to a greed for power and supremacy which is devoid of all sense of justice, the peace-loving nations must make concerted efforts to uphold the laws and principles on which alone peace can rest secure."

But what about "concert" with a "peace-loving" nation to which the United States denied the needed access to the sinews of war? The problem of neutrality is by no means solved by the act of May 1, 1937. Indeed, many believe that that act is more likely to involve the country in war than to keep it out. Another proposed deterrent of war was the resolution of Louis Ludlow, congressman from Indiana, to the effect that, except in case of defence against invasion, war shall be declared only on the vote of the people in a nation-wide referendum. This resolution, introduced in 1935, was buried in committee; but it was resuscitated in the extra session of November, 1937, by Senators La Follette of Wisconsin and Arthur Capper of Kansas and proposed as an amendment to the Constitution. Since the people fight the wars and suffer from them, it was urged that the people should decide whether wars were to be fought. The proposal was condemned by the president and officialdom generally on the ground that it would tie the hands of the executive, interfere with diplomatic negotiations, and reveal to foreign nations unfortunate divisions of opinion that were sure to exist. The nation must seem to be united, they argued, in case of a threat of war.

Furthermore, it was urged that a vote of the people, excited as they would be by belligerent propaganda in the press and on the platform, would be even more likely to commit the nation to war than would the diplomacy of the White House and the deliberation of Congress. When the motion to bring the Ludlow-La Follette-Capper resolution before the House soon after the opening of Congress was made in January, 1938, it was lost by a vote of 188 to 209. Even should the proposed amendment come before Congress, there is not a chance that two-thirds of the members of

both houses would voluntarily abandon their constitutional right to declare war.

An act of Congress of June, 1934, authorized the State department for three years to conclude reciprocal trade agreements with foreign nations, looking toward the release of world trade from the fetters which high national tariffs, quotas, currency embargoes and export restrictions had fastened upon it since the World War. On Feb. 25, 1937, Congress renewed the authorization for another period of three years. Up to the end of 1937 Secretary Hull had concluded 16 such agreements, and the most important one of all, that with Great Britain was nearing completion.

The result of the splendid work of Secretary Hull was shown not only in the improvement of trade with those countries which were parties to the agreements, but also in helping the cause of world peace through the substitution of mutually beneficial economic pacts for the jealous rivalry of nationalistic trade barriers, which, in the words of assistant secretary of State Sayre, "forge the thunderbolts of war." (See TRADE AGREEMENTS.)

United States relations with European nations during 1937 were amicable, despite a few tiffs with the rulers of Nazi Germany, who felt quite free to make the most disparaging remarks about democracies, while resenting as insults any criticisms of the Führer's pretensions and persecutions. Thus, when the mercurial mayor of New York, Fiorello H. LaGuardia, suggested that the New York World's Fair of 1939 might include in a building dedicated to the struggle for religious toleration a chamber of horrors with a statue of Hitler as exhibit No. 1, the German ambassador at Washington called upon Secretary Hull (March 4) to protest against the insult. The secretary expressed his regret informally, but remarked that he could not interfere with free speech and criticism in this country. Nor was the interpretation of democracy by the historian ambassador of the United States to Germany, Professor W. E. Dodd of Chicago, pleasing to the Nazi authorities, though Mr. Dodd refrained carefully from direct criticism of the régime.

He resigned on December 7, to be succeeded by Hugh R. Wilson, and on his return to this country spoke freely of the abuses of the Nazi government. Again Ambassador Dieckhoff protested, but was told properly that Mr. Dodd, as a private citizen, was free to speak as he pleased.

As to Latin-American relations, the chief business of the year 1937 was the implementing of the resolutions of the fruitful Inter-American Conference for the Maintenance of Peace, which met at Buenos Aires in December 1936. In April a committee on the Codification of International Law met at the Pan-American Union in Washington to formulate material on arbitration, conciliation, pecuniary claims, the definition of aggression, the application of sanctions, and in general the methods of prevention of war, to be submitted to the eighth Inter-American Conference, to be held at Lima, Peru, in December, 1938. Of the 16 commercial agreements negotiated by Secretary Hull, nine have been with the Latin-American countries. On October 21 the United States joined with Costa Rica and Venezuela in mediating a dispute between Honduras and Nicaragua, and on November 15 the President accepted a like invitation to use his good offices in a controversy between Haiti and Santo Domingo; but he rejected the proposal from Cuba to join the American republics in an attempt to mediate between the factions in the civil war in Spain. A flurry of excitement was caused in Washington early in October, when it was learned that President Getulio Vargas of Brazil, known for his sympathy during his seven years of power with the Fascist group, had declared martial law and suspended the constitution. The event was hailed in Germany, Italy and Japan, all of which countries had numerous settlers in Brazil, as an earnest of the accession of the great South American republic to the fascist bloc.

But the new constitution of Brazil, published in November, and containing a long bill of rights, showed that upheaval was more of the factional type of Latin-American "revolutions" than any servile copying of the Nazi or fascist régimes.

On the assurance to our State department by President Vargas that there was no connection between his "reforms" and the programs of the European totalitarians, and that the traditional friendship with the United States and respect for democratic institutions would be preserved, President Roosevelt, on November 11, decided on a hands-off policy, for the present at least, in regard to the Brazilian situation.

The only serious crisis in our foreign relation for 1937 came near the close of the year. In the mid-summer, the Japanese military authorities (who are not responsible to the Diet) set out in earnest to make a complete conquest of China. Without a declaration of war, and with the pretext of defending their legitimate interests, they ignored their plighted obligation under the Nine-Power Treaty of 1922 to respect the integrity and independence of the Celestial Empire, even as they had done in their seizure of Manchuria five years before. Between July 7 and November 9 they subdued five provinces of Northern China, with an area equal to that of France, Germany and Italy combined and a population of 80,000,000. On August 25 they declared a blockade of the 2,000mi. of Chinese coast and bombarded the native section

of the great international city of Shanghai, which they occupied on November 8. A week later they were approaching the capital of Nanking, from which the Chinese Government fled to a refuge 900mi. westward.

It was evident by the end of the year that, in spite of overwhelming numbers, the Chinese were unable to halt the advance of the highly trained and modernly equipped Japanese forces. And it was equally evident, from the terms offered to China after the capture of Shanghai that Japan was determined to reduce her to a vassal state. The United States Government was intent upon defending the lives and property of Americans in China and preserving the rights guaranteed by the Open Door policy and the Nine-Power Treaty. But in spite of warnings from Washington the work of destruction went on.

One American was killed and several were in imminent danger in the bombardment of Shanghai, and on September 22 Secretary Hull wrote a sharp note to Japan protesting against the air raids on defenceless cities. An advisory group of the League of Nations, backed by the United States, condemned the Japanese invasion of China, and a special conference met at Brussels on October 30, pursuant to article VII of the Nine-Power Treaty, to try to bring Japan to heel. But the conference (at which Norman Davis represented the United States) dissolved without accomplishing more than a warning to Japan that her behaviour was inconsistent with the principles of international morality.

Less than three weeks later an incident occurred which threatened to involve the United States in war with Japan. The U.S. gunboat "Panay," while conveying refugees up the Yangtze river, was attacked by Japanese bombing planes on December 12 and sunk with the loss of two American lives. While the boat was sinking and the astounded passengers were seeking to reach the shore, they were subjected to machine-gun fire from boats in the river. Three Standard Oil boats were also destroyed and two British river boats were shelled.

Prompt demand for apologies, indemnification, and the assurance of the non-repetition of such outrages was made from Washington, President Roosevelt even requesting that the protest be presented to the Japanese emperor himself, as the only superior power acknowledged by the military. At first the Japanese Government denied that the attack was intentional or that the gunfire had occurred. But when the report of the "Panay's" commander and the naval board of inquiry sitting at Shanghai refuted these contentions, and the United States Government insisted on "full satisfaction," Japan sent a new note (December 24), in which she made ample apologies and gave pledges that the attacks would not happen again.

The apologies and assurances were accepted at Washington, and the incident was officially closed—not without leaving an aftermath of resentment and suspicion, which was intensified by the exhibition of the "Sinking of the 'Panay'" films in the movie houses throughout the United States. (See also ARMIES OF THE WORLD; CHINESE-JAPANESE WAR; WATER POWER; WORLD ARMAMENTS.) (D. S. MU.)

**Transportation.**—For statistics on transportation, see the articles AERONAUTICS; AVIATION, CIVIL; INTERSTATE COMMERCE COMMISSION; MOTOR-BUSES; MOTOR CARS; MOTOR TRANSPORTATION; MOTOR TRUCKS; POST OFFICE; RAILROADS; SHIPPING, MERCHANT MARINE.

**Agriculture.**—Agricultural production for 1937 was marked by increases throughout the United States. Only in five Southern States and New Mexico were crop values less than in 1936, while considerable decreases in the value of livestock and livestock products in the Middle West were more than balanced by gains in other sections of the country. National crops jumped from \$3,462,425,000 to \$3,840,035,000 in value, while the income from

\*ESTIMATES FROM THE PRESIDENT'S BUDGET MESSAGE OF JANUARY 5, 1938

RECEIPTS (....) AND EXPENDITURES (—) of the Federal Government in fiscal years ended June 30; with surplus or deficit shown below

livestock and livestock products rose from \$4,171,000,000 to \$4,280,000,000. The States leading in combined output were (ooo omitted):

California . . . \$654,150	Ohio . . . \$334,850	Pennsylvania \$274,425
Illinois . . . 506,600	Kansas . . . 324,050	Missouri . . . 271,225
Texas . . . 505,950	Wisconsin . 321,150	N. Carolina . 258,850
Iowa . . . 497,550	New York . 310,450	Michigan . . 239,200
Minnesota . 341,500	Indiana . . 290,850	Nebraska . . 235,175

For a detailed discussion of price trends and other agricultural trends throughout the United States, see the article AGRICULTURE.

Individual agricultural products are separately treated, but a comparison of the trends of leading products emphasizes how generally output increased during 1937. Thus cotton, rising from 12,407,000 to 18,746,000 bales, reached the highest figure since the World War. Cottonseed and rice also exceeded any figures during the last 20 years, and the great increase in wheat production from 626,766,000 to 873,993,000bu. resulted in the largest output in recent years. Tobacco output reached 1,505,762,000lbs. another unusually large figure. Although corn, oats, hay and potato crops broke no records, all were above average. The shifting trends of American agriculture may be seen in the production figures for these crops since 1932 (ooo omitted):

Year	Corn	Oats	Wheat	Cotton	Cottonseed	Tame Hay	Rice	Tobacco	Potatoes
1932	2,931,281 bu.	1,250,955 bu.	756,927 bu.	13,003 bales	5,784 tons	71,827 tons	41,619 bu.	1,017,317 lbs.	376,425 bu.
1933	2,399,632	733,166	551,683	13,049	5,806	66,530	37,651	1,371,131	342,306
1934	1,461,123	542,306	526,393	9,636	4,282	55,270	39,047	1,081,629	406,105
1935	2,303,747	1,194,902	626,344	10,638	4,729	78,138	38,784	1,297,155	386,380
1936	1,507,089	785,506	626,766	12,407	5,511	63,536	49,002	1,154,131	331,918
1937	2,644,995	1,146,258	873,993	18,746	8,337	73,785	53,004	1,505,762	391,159

Production in all lines was far above the 1923-32 pre-drought average with 22 field crops at 109.6, eight vegetables for manufacture at 143.5, 17 vegetables for market at 130.9, and 13 fruits at 134.1.

**Manufactures.**—Industrial statistics released during 1937 covered production in 1935. While they disclosed a gain over 1933 figures, they did not approach the pre-depression figures of 1929. Totals for the three years were:

	1935	1933	1929
Establishments . . . . .	169,111	141,769	209,862
Wage Earners . . . . .	7,378,845	6,055,736	8,821,755
Wages . . . . .	\$ 7,544,338,434	\$ 5,261,576,029	\$11,607,287,151
Value of Product . . . . .	\$45,759,763,062	\$31,358,840,338	\$69,960,909,712
Value Added . . . . .	\$19,499,269,394	\$14,538,018,361	\$31,783,009,666

The distribution of the total value among the various industrial classifications and the percentage gain registered by each over 1933 was as follows (ooo omitted):

Classification	1935	1933	% gain
Food and kindred products . . . . .	\$9,510,674	\$6,604,036	44.0
Textiles and their products . . . . .	6,060,834	4,810,960	25.9
Forest products . . . . .	1,662,221	1,127,405	47.4
Paper and allied products . . . . .	1,523,186	1,172,743	29.9
Printing, publishing and allied . . . . .	2,164,995	1,726,425	25.4
Chemical and allied products . . . . .	2,837,315	2,117,513	34.0
Products of petroleum and coal . . . . .	2,464,274	1,871,494	31.7
Rubber products . . . . .	677,959	472,744	43.3
Leather and its manufactures . . . . .	1,224,431	996,773	22.8
Stone, clay and glass products . . . . .	946,480	608,099	55.5
Iron-steel products except machinery . . . . .	4,265,327	2,580,373	65.3
Non-ferrous metals and products . . . . .	1,668,561	951,381	75.5
Machinery excluding transportation . . . . .	3,816,332	2,065,803	84.7
Transportation . . . . .	4,305,629	2,058,195	109.0
Miscellaneous . . . . .	2,631,844	2,194,296	19.9

There were eight billion-dollar industries in the United States in 1935: motor vehicles and parts (\$3,942,014,123), meat packing (\$2,362,369,081), steel work products (\$1,931,318,220),

printing and publishing (\$1,891,638,715), petroleum refining (\$1,838,621,913), women's and misses' clothing (\$1,269,624,289), bread and other bakery products (\$1,235,072,900), and cotton manufacturing (\$1,030,767,654).

**Mineral Products.**—Statistics on mineral production released in 1937 covered 1936. These showed that production was continuing to increase from the 1932 low, although it was still considerably below that of the 1920's. Of the total production of \$4,582,000,000 as compared to \$3,650,000,000 in 1935, the following led with a product valued at over \$35,000,000 each: petroleum (\$1,150,000,000), bituminous coal (\$768,000,000), pig iron (\$541,694,000), natural gas (\$480,500,000), coke (\$232,374,000), anthracite coal (\$226,000,000), cement (\$172,681,000), gold (\$150,959,000), iron ore (\$131,741,000), stone (\$129,276,000), copper (\$112,499,000), sand and gravel (\$84,597,000), natural gasoline (\$81,750,000), ferro-alloys (\$69,135,000), zinc (\$49,180,000), silver (\$47,759,000), aluminium (\$41,612,000), lead (\$35,688,000), and sulphur (\$35,400,000). Comparative statistics regarding the quantity of single products may be found under articles on individual metals and non-metals.

**Foreign Commerce.**—United States trade increased rapidly during 1937. Exports valued at \$2,455,978,000 in 1936 already totalled \$3,026,872,000 by Dec. 1, 1937 and imports jumped from \$2,422,592,000 to \$2,875,202,000, marking the largest percentage

increase since the low point of 1932.

This expanding trade was accompanied by an increase in the proportion of exports over imports. During the first 11 months of 1936, the balance in favour of exports was only \$33,386,000

Total Imports and Exports 1932-1937  
(ooo omitted)

Year	Export Total	% Increase	Import Total	% Increase
1932 . . . . .	\$1,611,016	..	\$1,322,774	..
1933 . . . . .	1,674,994	3.9	1,440,559	9.6
1934 . . . . .	2,132,800	26.5	1,655,055	14.2
1935 . . . . .	2,282,874	7.0	2,047,485	23.8
1936 . . . . .	2,455,978	7.6	2,422,592	18.3
*1937 . . . . .	3,339,326	36.0	3,198,972	32.0

\*Including December estimate on basis of percentage increase for first 11 months.

as compared with \$151,670,000 from January to December 1, 1937. The gain was more notable as during the early months of 1937 there was an unfavourable balance which reached a high of \$50,909,000 during June. The trend turned in August and during October exports exceeded imports by \$108,408,000. Import duties collected for the period January through November jumped from \$363,081,000 in 1936 to \$437,412,000 in 1937, but over half the imports entered free.

The character of United States trade varied greatly according to area. The greatest change during 1937 was in Canadian trade, an unfavourable balance of \$2,362,000 being converted into a favourable balance of \$14,784,000. Exports to South America also gained sufficiently to pass the imports in value. A favourable balance with Central America, Mexico and the West Indies was further increased, but imports from Asia increased much more rapidly than exports to widen a balance already unfavourable. The outstanding feature in European trade was the small increase in imports, those from the United Kingdom actually declining despite the general trade increase. Statistics for the first 11 months of 1936 and 1937 by origin of imports and destination of exports was as follows (ooo omitted; exports listed first):

Year	N. America	S. America	Europe	Asia	Oceania	Africa
1936 . . .	\$56,318	\$18,806	\$ 98,832	\$38,849	\$5,352	\$ 8,208
1937 . . .	71,064	29,077	144,799	46,993	9,510	12,638
1936 . . .	51,102	23,146	64,678	52,156	1,547	3,769
1937 . . .	43,539	26,738	66,998	78,871	2,186	4,892

Examination of the leading items of export and import according to value reveals that petroleum and unmanufactured cotton are the main items of export and that the greatest dependence is upon tropical and Oriental raw materials and wood pulp. The following products led the import and export lists for the first 11 months of 1937:

Exports		Imports	
Product	Value	Product	Value
Petroleum . . .	\$347,540,265	Crude Rubber . . .	\$212,372,835
Cotton (unman.) . .	328,737,821	Cane Sugar . . .	160,127,712
Automobiles, etc. . .	307,135,229	Coffee . . .	139,069,653
Indus. Machinery . .	216,391,912	Newsprint . . .	111,357,709
Iron (semiman.) . .	213,597,669	Silk (unman.) . .	102,348,694
Tobacco (unman.) . .	113,748,562	Tin Bars . . .	95,040,374
Elect. Machinery . .	102,788,955	Wool (unman.) . .	94,482,512
Copper . . .	86,939,191	Wood Pulp . . .	90,936,495
Agric. Machinery . .	68,671,491	Furs . . .	83,331,155
Coal . . .	64,083,568	*Vegetable Oil . .	81,720,967
Steel Manuf. . .	60,616,729	Hides and Skins . .	67,501,399
Steel Adv. Manuf. . .	47,401,414	Corn . . .	56,069,106
Cotton Manuf. . .	40,011,467	Cocoa Beans . . .	50,824,792

\*Non-edible rather than edible vegetable oil.

For a special aspect of United States commerce, *see* TRADE AGREEMENTS and TARIFFS.

**Labour.**—For labour statistics, *see* the articles CHILD LABOUR; LABOUR; STRIKES AND LOCK-OUTS; UNEMPLOYMENT; WAGES AND HOURS.

**Finance and Banking.**—Financial statistics appear in separate articles such as BANKING; BUDGET; EXCESS PROFITS TAX; GOLD RESERVES AND GOLD STANDARD; GOVERNMENT EXPENDITURES; INCOME TAX; NATIONAL DEBTS; NATIONAL INCOME; PROCESSING TAX; SALES TAX; WEALTH AND INCOME, DISTRIBUTION OF.

**Defence.**—The size of both the U.S. Army and U.S. Navy increased during 1937. The regular army had 178,101 men of whom 164,993 were enlisted on July 1, while there were 14,110 officers and 178,051 enlisted men in the National Guard and 111,169 officers and 3,189 enlisted men in Reserve Forces. There were 100,810 enlisted men in the navy and approximately 17,000 in the Marines. Expenditures for the fiscal year 1936–37 exclusive of outlay for non-military purposes were: War Department, \$372,774,887 and Navy Department, \$497,083,719. At that time the United States had 15 capital ships, three aircraft carriers, 27 cruisers, 197 destroyers (158 over-age) and 83 submarines (54 over-age) and funds were appropriated for two capital ships, three aircraft carriers, ten cruisers, 55 destroyers and 17 submarines. For additional information regarding American military and naval forces, *see* AIR FORCES; ARMIES OF THE WORLD; MARINE CORPS; NATIONAL GUARD; NAVIES OF THE WORLD; WORLD ARMAMENTS.

**United States Government Departments and Bureaus:** *see* GOVERNMENT DEPARTMENTS AND BUREAUS.

**United States Housing Authority:** *see* HOUSING; MUNICIPAL GOVERNMENT.

**Universal Language.** Among artificial languages, Esperanto at present holds the field. According to the estimate of its advocates, it has some 500,000 users—or at least adherents; but it is naturally hard to find a reliable basis of calculation.

An extreme form of the view that an artificial language should be a simplification of languages already existing is the suggestion

that a simplified form of English should serve as interlanguage. The simplification suggestions are of two kinds: (1) spelling reform (Anglic); (2) restriction of vocabulary (basic English). The objection that, if an artificial language ever came to life, it would develop irregularities leading to dialectal divergence, seems to be answered by British and American English; so little divergence in four centuries can hardly be regarded as serious.

The objection that the language would be useless for literature because of its lack of associations is a fallacy. For generations we learned Greek myths with Latin names, Jupiter, Venus, Cupid; the associations were attached to these names as truly as if the Greek names had been used. Language conservatism is so strong that not improbably the interlanguage will be some mother-tongue modified by the cumulative effect of such partial movements as the attempt now being made in Germany to standardize technical terms.

(H. O. Co.)

**Universal Service:** *see* ARMIES OF THE WORLD: *Military Service.*

**Universities and Colleges.** The terms “university” and “college” are used in the United States more or less interchangeably to cover a widely diversified type of higher education. The U.S. Office of Education lists for 1937 1,704 higher educational institutions. The typical four-year liberal arts college is sponsored either directly or indirectly by one of the many religious denominations, or governed by a self-perpetuating board of trustees that has attained independent status by charter. The operating expenses of such institutions are met by interest from invested funds, tuition payments of students, and outright gifts of one type or another. The oldest colleges began almost with the beginning of the country. Provision was made for the establishment of State-supported universities at the time of the enactment of the Ordinance of 1787. The provisions of the Louisiana Purchase gave still further impetus to this movement. With the passage of the Morrill Act in 1862, provision was made for the establishment in each State at public expense of the so-called “land grant” colleges of agriculture and mechanic arts. Almost all the States maintain one or more special institutions for the preparation of teachers at public expense. Municipal colleges or universities are common. These are supported by city tax as distinguished from a tax levied by the State or Federal government. Among the well-known institutions of this class are the College of the City of New York, the University of Cincinnati, and Wayne university, Detroit, etc.

There are many comprehensive universities that offer not only work in arts and sciences leading to the baccalaureate and higher degrees, but a range of courses which prepare for such professions as law, medicine, dentistry, journalism, business administration, and engineering.

More than five hundred (553) junior colleges are now in operation. Some of these mark the determination on the part of the four-year liberal arts colleges to concentrate their efforts on the first two years. Others have been created by municipal agencies through public taxation in order to provide two years of work beyond the high school. The private junior colleges report an attendance of 43,045. The public institutions of this class enroll 93,578 students.

American colleges tend to become alike. It must not be forgotten that a distinctive feature of higher education in America is the ease with which students are admitted in the first place, and the readiness and extent of student transfer between institutions during the college career. This great mobility of the student population no doubt contributes much to the fact that there is

a marked degree of overlapping among all types of higher institutions. The University of Chicago reports that 30% of its undergraduate students are admitted as transfers after attending a junior college. In recent years many two-year State normal schools have become degree-granting teachers' colleges. The colleges of agriculture and mechanic arts have, with the passing of the years, so modified their curriculums and staff as to attract many students whose interests and capacities are identical with those of students going to so-called liberal arts or humanistic universities. On the other hand, liberal arts colleges have expanded in the direction of providing "practical" work in such fields as commerce, journalism, and the applied arts. Much of the current discussion about the purpose of the college centres upon this change. President Hutchins, of the University of Chicago, has gone so far in his criticism of the present tendency as to recommend a return to the mediaeval trivium and quadrivium.

*Teacher Training.*—With the growth in secondary education has come a great increase in the demand for trained teachers. Practically all colleges of the country have sought to satisfy this demand. Whereas the typical normal school has expanded its offerings so as to grant both undergraduate and graduate degrees to prospective teachers, the colleges have sought to meet the technical requirements for teachers by providing courses in education to satisfy teacher certification requirements. Such work is offered on both the undergraduate and the graduate levels. This overlapping and expansion of function has come about so gradually that only now is its full extent being generally recognized. There is much reason to believe that many colleges and universities will move in the direction of a closer co-ordination of these diverse interests within each institution. Recently Harvard and Chicago have reorganized their programs of teacher training so as to provide for a better adjustment between subject matter and technical preparation of a teacher. The tendency toward recognition of the highly specialized function of the teacher by designation of a special graduate degree is increasing.

*Voluntary Associations.*—Without entering the field of professional education, it may be said that, in attempting to understand the American colleges and universities, it is important to recognize the fact that few centralizing governmental agencies have power to inspect or modify these educational institutions. There are, however, very powerful standardizing agencies that are wholly co-operative and voluntary. These voluntary agencies, such as the Association of American Universities (which includes 32 important institutions, distributed geographically from the East Coast to the West, and varying in size from Columbia and Minnesota to Princeton and Johns Hopkins), constantly strive for improvement in the upper reaches of higher education. Through committees, standards are adopted, ideas are promulgated, and approved lists of colleges are published. Voluntary regional associations, such as the North Central Association of Colleges and Secondary Schools, are highly influential. Other such regional associations are the New England Association of Colleges and Secondary Schools, the Middle States Association of Colleges and Secondary Schools, the Southern Association of Colleges and Secondary Schools, and the Western Association of Colleges and Secondary Schools.

*The College and the Individual.*—The college entrance examination board has been a very effective agent in the selection of college students for a restricted list of colleges situated chiefly in the Eastern States. Other students have been admitted by certificate showing graduation from the secondary school. In view of the close working arrangements between the colleges and the secondary schools, either of these methods should afford a thoroughly satisfactory basis for selecting the right students for each college.

Scientific scrutiny of individual differences among the students admitted to the various colleges indicates that it may be necessary either to supplement present standards of selection in such manner as to assure a more homogeneous group of students in each class, or frankly to recognize the wide differences among individuals by making special provision for a wider sampling of student material. The general undergraduate colleges recently established at the universities of Minnesota and Florida, and the general studies division at Yale on the graduate level, are instances of institutional recognition of these broad differences in capacity and purpose.

*College Testing.*—Interest in testing programs for the college area has spread widely. Tens of thousands of students in hundreds of colleges are being tested annually by the Co-operative Test Service which operates under the general direction of the American Council on Education. The Carnegie Foundation for the Advancement of Teaching is reporting its findings after eight years of study of 17,000 students enrolled in Pennsylvania colleges. The achievement of students, as measured by an appraisal of their enduring knowledge, differed much more widely than had been anticipated. It was found that some colleges were very much more successful than others in selecting and holding competent students, and that the relative standing of individual members of the same class differed unbelievably. For example, the spread of achievement in the senior class was so great that the weakest seniors were no better than the best freshmen. Indeed some of the best high school students stood higher than the poorest college seniors. Steps are being taken in some of the colleges to capitalize this information by a shift of emphasis in the selection and advancement of students.

Chicago, Columbia, and Harvard, and many smaller colleges are using comprehensive examinations as a means of improvement. It is the fashion to adopt a "plan." The Chicago plan, the Columbia plan, the Harvard plan, the Princeton plan, the Rollins plan, the Yale plan, and so on *ad infinitum*, fill the pages of college catalogues. While they differ somewhat in detail, they are inspired by a common desire to modify the offerings of the college to conform to the change in certain social, economic, and scientific aspects of life and to select students who can better profit by such offerings. This ferment is widespread. Almost every college has one or more committees at work on the task of improving the effectiveness of its undertaking.

*Support of Colleges.*—Last year the Federal government, through the National Youth Administration, provided employment for many students who were thus enabled to continue their education during a period of severe economic strain. In ever-growing numbers, parents make the personal adjustments necessary in order to send their children to college. Donors are still giving large sums of money to higher education. Tax-levying bodies, on the whole, have been generous. The fact that more than 79,000 graduate students were enrolled during the year 1936 is one measure of the student persistence in higher education. Medical schools are unable to admit all applicants for study. Extension courses, Saturday courses, summer courses are crowded.

The current scene in American higher education displays a growing recognition that individuals differ from one another in mental equipment and in the lives they lead. During 1937, steps were taken at many points to make the needed administrative adjustments to decrease the rigidity of requirements at all levels and to focus attention upon the outcomes of education as reflected in the students themselves.

(W. A. J.)

The following six pages carry a selected list of universities and colleges throughout the United States, with location, year founded, chief executive, enrolment, size of faculty, endowment and number of library volumes.

Institution	Location	Year Founded	Chief Executive	Full Time Students	Full and Part Time Students	Faculty	Endowment	Library Volumes

NOTE: Enrolment and faculty statistics are for the 1937-38 term and are based on figures compiled by President Raymond Walters of the University of Cincinnati in *School and Society*, Dec. 18, 1937. Endowment and library statistics are for the latest date with generally comparable figures (1935-36).

**Great Britain.**—The year 1937 witnessed steady developments in the majority of university institutions in Great Britain and Ireland. A brief conspectus of the progress achieved in the Universities of the Joint Constituency, *i.e.* all those in England excluding Oxford, Cambridge, and London affords the best illustration of the active policy which is being pursued by one and all.

At Birmingham, building on the new university site at Edgbaston continued, and it is expected that the new hospitals centre and medical school will be opened in 1938. Work is also proceeding on the Barber Institute of Fine Art. A special course leading to the degree of B.Sc. in coal utilization was instituted, its object being to train young men of sound general education in the processes connected with the treatment of coal, its use, and the economic factors involved in marketing the finished product.

At Bristol, plans for the new dental school were approved, a large number of junior teaching appointments were created, a certificate in applied bacteriology was instituted, and a social survey was made. The University of Durham was reorganized under its new statutes in two divisions—Durham and Newcastle—under separate administrative heads. In Leeds, plans for additions to the central block of the university and for the Union buildings were approved, a new boathouse was erected, and headquarters were assigned for the O.T.C. At Liverpool, the Cohen library and the Harding gymnasium were in course of erection, and a board of Clinical Studies was substituted for the Clinical school. At Manchester, the new library was opened and the appointments board reorganized. In Reading proposals were under consideration for a new hall of residence for women. At Sheffield, work was in progress on new buildings for the department of glass technology and on a number of other extensions.

**Canada.**—In Alberta, field crop problems are being investigated; in the University of British Columbia, a department of university extension has been organized and work in forestry has been extended; at Dalhousie, a physical instructor has been appointed; in McGill, a residence for men has been provided; in Manitoba, the departments in agriculture have been reorganized and a number of new appointments made; in Toronto, preventive medicine is becoming more and more a major subject in the medical curriculum, new courses have been provided leading to B.Sc. in mining geology and for sanitary engineers, and graduates in forestry are in increasing demand.

**Australia.**—In Australia, as elsewhere, interest in student life was displayed, by the University of Adelaide, for example, in the erection of the George Murray building for the men's union and the bridging of the Torrens to connect the sports oval with the university grounds, and by the University of Melbourne in the provision of a students' union containing all facilities for staff and students at a cost of £67,000.

**South Africa.**—The Carnegie Corporation of New York made a grant of \$45,000 to the University of Capetown for research under the auspices of the university into the marine ecology of the South African coast and the growth and storage of deciduous fruit, as well as for making a linguistic, ethnographical, and demographic survey of the Langa native location and a social survey of Capetown. Among the new posts created at Capetown is a lectureship in the Bantu languages.

**India.**—In India many of the universities, as in other countries, partly because of the growth of unemployment and partly through the realization of the necessity for action on their part, began to show an increased interest in students' welfare. In Calcutta, an Appointments and Information Bureau was established. In Madras, proposals for a similar institution were under consideration. In Mysore a post of superintendent of physical education was sanctioned. In Osmania university, hostels for 400 students have been provided.

**China.**—In China, one of the most interesting developments was the proposal of the University of Yenching to reorganize its teaching arrangements on the lines of the Oxford "Modern Greats." Advisers with a knowledge of the Oxford system were appointed with a view to examining how far this scheme could be realized.

**Japan.**—In Japan, with its five Imperial universities on the mainland, one in Korea, and one on Formosa, there have been no special developments except at Tohoku university, Sendai, where an Institute of Agriculture and Fisheries has been established with the main purpose of studying the north-eastern agricultural and fishery problem. Experiments are being made into the possibility of substituting barley and wheat for the paddy crops and also of increasing the supplies of fish around this area. During recent years various Japanese professors have visited Great Britain and have delivered lectures at universities and elsewhere.

**Palestine.**—At the Hebrew university of Jerusalem, a "medical centre" is being erected in the vicinity of the university, to consist of a medical school, university hospital, and a nurses' school.

**Denmark.**—The University of Copenhagen completed its first year under its new constitution of 1936. The library is preparing to move to a new academic quarter on the outskirts of the city. Aarhus university has inaugurated a new institute for biochemistry and physiology.

**France.**—French universities have little to record in the way of outstanding developments. The number of students has declined by over 8,000 since 1934–35. A "Service Central de la Recherche Scientifique" has been established to co-ordinate research work. The retiring age of professors has been lowered to 65 years.

**Germany.**—On June 27 the University of Gottingen celebrated the 200th anniversary of its foundation. Invitations to attend the celebrations had been declined by the universities of Oxford, Cambridge, Yale, Princeton, Amsterdam, Leyden, Utrecht, and Groningen, and had been accepted with reservations amounting to a refusal by Harvard.

**Greece.**—In Greece, there were only minor developments; but a closer rapprochement with British culture was provided for by the creation under the aegis of the British Council of the Byron Chair of English Literature and Institutions at the University of Athens.

**Norway.**—At the University of Oslo, funds were provided for a new institute of bacteriology.

**Poland.**—In Poland, where there are now 16 institutions of higher education, with 40,000 students, the most important development was the Act of July 2, 1937, whereby chairs can no longer be abolished by the minister of Public Instruction without the consent of the board of the faculty.

**Portugal.**—The University of Coimbra celebrated the 400th anniversary of its final establishment. A centre of Brazilian studies was inaugurated. The faculty of engineering of the University of Oporto was installed in a new and fully-equipped building, and its former premises were absorbed by the faculty of science. In the University of Lisbon, the faculty of medicine added new laboratories and the new Higher Technical Institute building was equipped at a cost of £250,000. A national station of agronomy was established.

**Russia.**—In Russia, one of the most important features was the fixing of the salaries of the teaching and the administrative staffs of universities and of the grants made to all students.

**University Professors, American Association of:** *see* ACADEMIC FREEDOM.

**Upper Silesia:** *see* SILESIA, UPPER.

**Uriu, Sotokichi,** BARON (1857-1937), Japanese admiral who graduated from the U.S. Naval Academy in 1881, took an active part in both the Chinese-Japanese War of 1894 and the Russo-Japanese War of 1904-05. Born at Daishoji in 1857, he was known for many years as a champion of Japanese-American friendship. His death occurred at his Odawara home, Nov. 11, 1937.

**Uruguay,** a republic on the Atlantic coast of South America; language, Spanish; capital, Montevideo; president, Gabriel Terra. The area is 72,153 square miles. Population (1933) 1,993,234; (estimated, 1935) 2,035,440. There is a large Italian admixture, and a greater percentage of whites than in any American country except Canada and Argentina. The chief cities are Montevideo (658,284) and Paysandú (40,000).

**History.**—Uruguay is governed by an elected president and congress. The year 1937 was uneventful, and was marked chiefly by efforts of the Government to reach an agreement with holders of defaulted bonds and to improve external trade relations. In July an important debt adjustment agreement with the Foreign Bondholders' Protective Council was approved by congress. Under its terms, interest rates on four issues of external bonds aggregating \$52,947,500 were scaled down, from an original 5% to 8%, to 3½% to 4½%, with interest and amortization to be resumed in 1938. Later in the year, announcement was made that the Government planned to offer holders of defaulted City of Montevideo bonds an exchange of national bonds, at a lower rate of interest. In May, the minister of finance visited the United States in an effort to effect a trade agreement and liberalization of tariffs, especially on frozen meat. No immediate result developed.

**Trade and Communication.**—Uruguay is directly connected by railway with Brazil and Argentina, by air with all parts of America, and by water with other parts of South America, the United States, and Europe. There are 1,650mi. of railways, and over 3,000mi. of national and 5,000mi. of local highways. In 1936 imports were 65,935,000 pesos (Great Britain, 18%; United States, 13.4%), with mineral oils, sugar, and coal leading. Exports were 90,300,000 pesos, comprising principally wool, meat and meat products and wheat, with Great Britain (25.8%), the United States (15.5%), and Germany (11.2%) the leading customers.

**Agriculture.**—Uruguay is primarily pastoral and agricultural. In 1930 there were 7,127,912 cattle and 20,558,124 sheep. Live-stock and products account for 96% of the exports, largely wool. Agricultural production, chiefly wheat, corn, and linseed, is valued at 10,000,000 pesos annually. Canning of meat for export is an important industry. Uruguay has 400,000 hectares (1 hectare equals 2.47 acres) of natural forests and 380,000 hectares of reforested areas.

**Finance.**—The monetary unit is the peso (value: 55¢ in the U.S.). Government receipts in 1936 were 90,921,991.69 pesos; expenditures were 86,215,019.47.

**Education.**—Education is compulsory and free. In 1935 there were 1,563 elementary and secondary schools, with an enrolment of 196,346. The National university at Montevideo has a high standing. (See also WATER POWER.) (L. W. BE.)

**U.S.S.R.:** see UNION OF SOVIET SOCIALIST REPUBLICS.

**Utah,** a Rocky Mountain State, admitted to the United States in 1896, is popularly known as the "Mormon State"; area, 84,990 sq.mi.; population in 1930, 507,847; in 1937, 520,000 (estimated). In 1930 there were 495,955 native whites, 1,108 negroes, and 10,784 persons of other races, including 4,012

Mexicans, 3,269 Japanese, and 158 Filipinos. Salt Lake City, the capital, had a population of 140,267 in 1930 and 149,000 (estimated) in 1938. Other cities: Ogden, railway centre (1930), 40,272; Provo, seat of Brigham Young university (1930), 14,766; Logan, 10,061.

HENRY H. BLOOD, governor of Utah

at 40% and that of the rural districts at 60%. In recent years the Mormon social security program has attracted national interest.

The twenty-first legislature which met in 1937 was characterized by its progressive character. The progressives, led by Dr. Herbert Maw, president of the senate, enacted their program, but the conservative minority, led by Governor Henry H. Blood, controlled patronage. Notable measures enacted were a direct primary law which provides for run-off primaries and an increase in the number of districts in counties having more than one representative in the legislature; a social security act passed in conformity with Federal legislation; a "little Wagner act," which provides for recognition by employers of employee-established bargaining agencies and sets up agencies with power to subpoena witnesses and hear disputes; and a fair-trade practices act to curb monopoly and prevent discrimination against buyers. Governor Blood vetoed a measure exempting from taxation homesteads up to \$2,000 and personal property up to \$300 on the ground that the exemptions would jeopardize the operation of the social welfare laws. The legislature was criticized in the Salt Lake City press because it enacted a budget of \$7,651,328, the largest in the State's history and more than \$1,300,000 above the Governor's figure, which was based on a revenue expectancy of little more than \$6,000,000. The bonded indebtedness of Utah as of June 30, 1937, was \$8,205,000 against which there is a sinking fund of \$4,968,715. E. E. Monson was secretary of State; John W. Guy, auditor; Reese M. Reese, treasurer; Joseph Chez, attorney-general; and Charles H. Skidmore, superintendent of public instruction.

**Education.**—The University of Utah, Salt Lake City, has an enrolment of 3,999, the Utah State agricultural college, Logan, 2,654, and Brigham Young university 2,400. A new junior college is being established at Price.

**Agriculture, Manufacturing, Mining.**—Mining and agriculture are the State's chief industries. Utah had 543 manufacturing establishments in 1935 with an output valued at \$115,923,000. Mineral production for the same year totalled \$41,881,265 with copper, silver, gold, coal and lead all worth over \$5,000,000. The gross income from agriculture and live stock in 1935 was \$40,265,000 with wheat and sugar-beets, the leading crops, valued at \$3,536,830 and \$2,570,480 respectively.

Salt Lake City is an important airway centre and the hub of highways which lead to scenic points of the West including the State's famed Bryce canyon and Zion park. (F. W. GA.)

**Utilities:** see PUBLIC UTILITIES.

**Uzbek S.S.R.** An important Central Asiatic Soviet Republic, a member of the U.S.S.R. (q.v.), bordering on Afghanistan, the republics of Turkmenistan, Kazakhstan, Tajik S.S.R., and Kirghiz S.S.R. and in the north on the Aral sea. Capital, Tashkent; national flag, red ground with the name of the republic in gold in the top left corner in Uzbek and Russian. Leading cities: Tashkent (1936) 515,000 inhabitants, and Samarkand (1936) 130,000 inhabitants.

Area: 370,000 sq.km. (mountain landscape, with great oases especially in the Fergana valley). Population (1933), 5,418,000 (rural 4,117,000, urban 1,301,000). The total number of school pupils (1936-37) was 791,000. On Feb. 14, 1937, a new constitution was adopted in Tashkent by the Sixth Extraordinary Uzbek Soviet Congress. In the summer of 1937 in Uzbekistan as in other Union republics, many of the highest State and party officials (including the premier Khodzhaev and several commissars) were dismissed as alleged Trotskyist and Fascist agents and imprisoned for anti-Government activities.

Sown area (1936), was 102,907 sq.mi. Chief products: cotton (first place in U.S.S.R.), rice, fruit, grapes. Stockfarming of sheep, and the valuable Astrakhan lamb is carried on. Natural resources include copper, sulphur, and oil. Technically and economically the most advanced of the Central Asiatic Soviet Republics, the Uzbek S.S.R., produces four-fifths of the total central Asiatic industry. Retail trade turnover: (1936) 3.4 milliard roubles. Chief export articles: cotton, silk, wool, hides (Persian lamb). Imports: grain. Output of industry (1936, at prices 1926-27): 1,175 million roubles. Output of electricity (1936): 230,000,000 kilowatt-hours. Industries: cotton, wool, silk, leather, oil, machine building. Length of railways (1936): 1,877km. (two-thirds of the total railways of Soviet Middle Asia). Freight carried (1936): 10,659,000 tons. (S. YAK.)

**Vaccination:** see MEDICINE: *Vaccination*; SERUM THERAPY.

**Vaccines and Vaccine Therapy:** see SERUM THERAPY.

**Vanadium.** Required as a constituent in certain types of high grade alloy steels and cast irons, vanadium is produced in considerable quantities. The chief producers are Peru, South-west Africa, Northern Rhodesia and the United States, with small amounts from Norway and Venezuela. In addition to the metallurgical uses, there is also a growing demand for vanadium catalysts in the production of sulphuric acid and certain organic compounds, as well as in the ceramic and dyeing industries. (See also RADIUM.) (G. A. Ro.)

**Vanderlip, Frank Arthur** (1864-1937), American banker, was known chiefly as assistant secretary of the treasury from 1897-1901 and as president of the National City Bank of New York from 1909-19. Born on Nov. 17, 1864, upon an Aurora, Ill., farm, he first worked as a machinist and as a reporter for the local newspaper. He entered the financial field through the sponsorship of Joseph French Johnson, whom he succeeded in 1889 as financial editor of *The Chicago Tribune*. In this post and as editor of *The Economist*, a Chicago weekly publication, he achieved such influence that he was summoned to calm the excitement following a crisis closing the Chicago Exchange. Secretary of the Treasury Lyman Gage recognized his worth by employing him as private secretary in 1897 and securing his promotion to assistant secretary within three months. In this post, he gained national prominence by successfully floating a \$200,000,000 Spanish war loan. As a result, he was summoned to the National City Bank in 1901. As a vice-president of that institution, he specialized in international finance and became its president in 1909. During his

ten years of service, deposits increased rapidly and the bank's interests abroad were rapidly extended. Following his resignation in 1919, much of his time was occupied with investigating graft through the Citizens Federal Research Bureau, which he organized in Washington. He dropped this work in 1924 and resumed his financial activities as special partner of a stock exchange firm during the following year. He died in New York city, June 29, 1937.

**Van Zeeland, Paul** (1893- ), Belgian statesman and economist, born at Soignies, was educated at Louvain and Princeton (U.S.) universities. He entered the Belgian National bank in 1922, and became its secretary in 1924 and a director in 1926. As professor in the Faculty of Law at Louvain (1928), he founded the Louvain Institute of Economic Sciences. Between 1922 and 1933 he represented his Government at various international conferences, including Stresa (1932). In 1931 he visited Russia, and wrote *Reflections on the Five-Year Plan*. In 1934 he was minister without portfolio in the De Broqueville cabinet, and on March 25, 1935, became prime minister of a Coalition Government, holding also the portfolios of foreign affairs and foreign commerce. This Government resigning in May 1936, he formed a new one on June 14, and immediately thereafter presided at the Assembly of the League of Nations. Severely attacked in Parliament in 1937, he won in April a decisive victory in a by-election at Brussels against M. Degrelle, the Rexist leader and in September, after a spirited defence, received a vote of confidence in Parliament. Attacks on him, on the ground that while premier he had received money from the National bank, continued, and he resigned office on October 25. In April 1937 he undertook, at the request of Britain and France, an international economic mission to explore the possibility of overcoming obstacles to international trade, and visited the United States in June, to confer with President Roosevelt.

**Vaporin:** see PRINTING.

**Vargas, Getulio:** see BRAZIL: *History*.

**Varnishes:** see PAINTS AND VARNISHES.

**Vassar College** continued in the year 1937, the seventy-third of its existence, to offer to women a liberal arts education on the university level. The curriculum maintains the principles of distribution and concentration but leaves the choice of particular subjects and of special fields to individual election. It calls for concentration for three and one-half years of the academic studies in a major field leading to a comprehensive examination. For the first time, these comprehensive examinations were taken during 1937 by all members of the senior class. In instruction, there has been an increasing trend toward smaller classes, individual conferences, and independent study.

In the academic year 1937-38 various departments co-operated in a program for the study of housing, comprising a talk by Mrs. Franklin D. Roosevelt on the rôle of women in a housing program, a two-day conference organized by the student political association and led by outstanding authorities in the field of housing, and a series of seminars and lectures by housing experts. With this background, 25 students carried on individual housing studies in their major fields.

A Vassar College Social Museum was established to further research in regard to Dutchess county (within which Vassar is situated), past and present, to train students in presenting local source material by the methods of visual representation, and to collect and render available Dutchess county data.

The reconstruction of Ely Hall in 1937 provided a faculty aula and new quarters for the geology department, including a museum with modern equipment. Taylor Hall and the Thompson library have been joined by the Van Ingen library comprising a three-tier stack with 100 reading stalls and studies, an art library, and additional rooms for the department of art.

(H. N. MACC.)

**Vatican,** the papal palace of the Vatican at Rome, with its museum and gardens, St. Peter's, and the area immediately adjacent (including the Piazza di San Pietro), with 13 scattered buildings in other parts of Rome which enjoy extra-territorial rights, forming (since 1929), a sovereign State, completely surrounded by Italian territory, under the temporal rule of the pope, who appoints a civil governor with full executive powers. Ruler, Pope Pius XI (elected 1922). National flag, the papal standard of white and yellow, charged with St. Peter's Keys and the triple papal tiara.

**Area and Population.**—Area: 108½ acres; population (census 1932), 1,025. All the inhabitants are Italian-speaking Roman Catholics, mostly of Italian or Swiss origin. The circumstances of the State make governmental provision for elementary education unnecessary. New buildings for the Papal university were inaugurated in Nov. 1937.

**History.**—The Concordat agreed upon between the Holy See and Yugoslavia, passed after heated debate by the Yugoslav lower house (skuptshina) in July, was abandoned in October before its submission to the senate. Diplomatic relations with Ecuador were resumed and a papal nuncio sent after a breach lasting 50 years; and in August, General Franco's government in Spain was officially recognized, representatives being exchanged. A Pontifical Academy of Sciences, including several British members, was inaugurated on May 31. In August, Fr. Alfonso Camillo de Romanis, O.S.A., was appointed to succeed Fr. Zampini, who had died in June, as papal vicar-general of the Vatican City. The small model prison built in 1936 received its first inmate during the year—a prisoner charged with insulting a gendarme.

**Communications, Currency, etc.**—There is a railway station connected by a short line (about 200yds.) with the Italian railway system; a radio station, from which the pope occasionally broadcasts; and a State postal service, which issues its own stamps. Italian money circulates, but the Vatican State also mints its own coins, corresponding with Italian coins in weight and fineness, though bound by agreement not to mint more than 1,000,000 lire's worth of non-gold coins in any one year. An agreement was made in 1937 by which the Vatican would issue coinage to the value of 800,000 lire, including silver 10- and 5-lire pieces, nickel 2- and 1-lire and 50- and 20-centesimi pieces, and copper coins of 10 and 5 centesimi.

**Defence Forces.**—The only "defence forces" are the papal bodyguard, the "Swiss Guards," numbering about 100, and the papal gendarmeries of about 70. The Piazza di San Pietro is, by treaty, subject to the powers of the Italian police.

**Vegetable Oils and Animal Fats.** The wide development in new uses of vegetable oils and animal fats by modern industry and science is shown graphically by data from the United States Department of Agriculture and has timely, practical interest because of the record cotton and cottonseed crop, the large production of corn, soybean, peanut and other crops in 1937, all of which are important world sources of food and industrial oils. Twenty-five years ago consumption of vegetable oils and animal fats in the United States was about 5,000,000,000lbs. annually. Through

discoveries and improvements in industrial processes a record of 9,000,000,000lbs., or about 74lbs. per capita, was reached in 1929, and it is now considered that consumption will again reach this figure in 1938 and may possibly exceed it.

Butter, lard, and cottonseed oil have generally composed 55 to 65% of the vegetable oils and animal fats used. Drought years and agricultural adjustments that have affected lard and cottonseed oil production have resulted in wider use of other oils and fats, including soybean, corn, peanut, coconut, palm, teaseed, hemp, perilla, linseed, tung, sunflower, rape and sesame oils, and whale and other marine oils, oleo and oleo-stearine. About 70% of these oils and fats, the Department of Agriculture asserts, is used in foods. Approximately 18% goes into the manufacture of soap, and about 8% is for drying uses in paint, varnish, ink, linoleum, and oilcloth. All these oils are sharply competitive one with the other, since many of them can be used interchangeably and supply and price govern the choice, whether a manufacturer uses whale oil from the Antarctic, babassu oil from Brazil, rape from India, cottonseed oil from the South in the United States, sunflower oil from Russia, corn oil from Missouri, or soybean oil from Illinois, lard from Iowa, peanut oil from Virginia, palm oil from Africa or coconut oil from the Philippines. So sharply competitive are many vegetable oils that until recently, when a ready method of identification was developed, teaseed oil was increasingly used as a substitute for olive oil. While many oils can be used interchangeably in processed foods, three, castor bean, croton, and tung oil, cannot be so used because of their aperient qualities. The chart reproduced above, from the U.S. Department of Agriculture's publication *The Agricultural Situation*, shows how different fats were used interchangeably in the manufacture of a very familiar product in the United States, oleomargarine, and how world-wide production competes as the supply of different fats and oils is abundant or scarce and prices, accordingly, are advantageous or unfavourable. (See also Cotton: Cottonseed.) (S. O. R.)

**Venereal Diseases.** Syphilis and gonorrhoea emerged from the shadows of mere scientific nomenclature in 1936. In 1937 they were definitely adopted into the vernacular vocabulary. In Dec. 1936 a Conference on Venereal Disease Control was held in Washington, attended by leading health officers and physicians from all parts of the country; President Roosevelt's greeting to that Conference used the words "venereal diseases" for the first time in any presidential paper. Governor Herbert H. Lehman of New York a few weeks

later endorsed "the battle against syphilis" in vigorous terms, his comments constitute a first known use of the term in gubernatorial papers.

Sampling polls conducted throughout the United States by the American Institute of Public Opinion showed wide public support for venereal disease control; majorities ranging from 79 to 92% supported a vigorous educational campaign, free public clinics, blood tests as pre-requisite to marriage licences, a Congressional appropriation of \$25,000,000 for venereal disease control, free blood tests. In a city-wide poll taken in August, Chicago's health officer, Doctor Herman N. Bundesen, found that 93% of those who voted were willing to take free and confidential blood tests.

Syphilis education up to the spring of 1937 was concentrated on creating an awareness of the problem. The 518,000 new cases of syphilis and 598,000 old cases, reporting annually to doctors, were emphasized. Pictorial charts were used to emphasize the definite results to be expected from the Co-operative Clinical Group system of treatment and from such venereal disease control programs as those of Sweden and Denmark.

With 1937, syphilis education took on a new note. Major voluntary organizations pressed for definite action to establish venereal disease control programs throughout the country. Among these were the General Federation of Women's Clubs, the Young Men's Christian Association, the American Legion, the United States Junior Chamber of Commerce, the Lions International and many others. Voluntary campaigns were co-ordinated through the American Social Hygiene Association. Syphilis education, therefore, stressed the economic aspects of syphilis. With more than \$41,000,000 spent annually for the repair of those mentally and physically disabled by syphilis, the logic of spending a large fraction of that sum to curtail the disease was pointed out. Second stress of the campaign was the effort to dramatize the scientific character of modern diagnosis and treatment; it was felt that public confidence in the reliability of medical instrumentalities of clinic and laboratory, rather than the traditional horror-emphasis of the earlier school of syphilis education, would be most useful in building effective programs for control.

Public education deserves the lion's share of discussion for the year 1937. To the historian of ten years from now certain promising scientific developments may loom much larger. Fever therapy, long used in the treatment of central nervous system syphilis in certain cases, was applied to the treatment of gonorrhoea; sensational results were reported, but it is yet too early to estimate the permanent place of this therapy. The drug sulphanilamide has been introduced during the year, also in the treatment of gonorrhoea; if long-time clinical observation bears out its early promise it will revolutionize the treatment of gonorrhoea as notably as the arsphenamines revolutionized the treatment of syphilis.

During the year three new American States adopted laws making the blood test pre-requisite to the issuance of marriage licences—Illinois, New Hampshire, and Michigan. Connecticut previously had such a law. Public health facilities for the control of syphilis have expanded rapidly. Of \$10,000,000 currently budgeted from Social Security funds allocated for public health purposes to be used as grants-in-aid to the States, \$827,000 is budgeted for venereal disease control. In addition, other funds will be expended in research and will supplement local health programs. (See also STATE LEGISLATION: *Health*.) (T. P.)

**Venezuela**, a federal republic in Northern South America; language, Spanish; capital, Caracas; president, Eleazar López Contreras. The area is 393,976 sq.mi.; population (1936 census) 3,406,073. The chief cities, with their popu-

CRUDE PETROLEUM PRODUCED in Venezuela

lations, are: Caracas, 203,437; Maracaibo, 99,171; Barquisimeto, 50,774; Valencia, 49,963.

**History.**—The main features of Venezuelan development in 1937 centred about the efforts of President López Contreras to place the country on a relatively democratic basis and at the same time maintain internal stability. During the year a number of alleged Communists were exiled, and past political exiles were denied re-admission. Several strikes were adjusted peaceably, in sharp contrast to the procedure under the recent Gomez dictatorship (1907-35). In furtherance of the reform policy launched in 1936, several laws were enacted for improvement of labour and agriculture and for the better control of foreign residents. Late in the year formal negotiations for a reciprocal trade agreement with the United States were begun.

**Trade and Communication.**—Venezuela has steamship communications through La Guaira (the port for Caracas), Maracaibo, and other ports, and adequate external air communication. There are 683mi. of railways and a relatively good highway system. Navigable rivers, especially the 4,000-mile Orinoco system, provide inland communications. Foreign trade in 1936 aggregated 980,053,169 bolivares in value, an 11.7% increase over 1935. Imports (textiles, foodstuffs, and miscellaneous manufactured articles) totalled 211,590,300 bolivares in 1936, an increase of 27.6%, with the United States supplying 47%. Exports were 768,462,869 bolivares value (an 8% increase), 89% of which was in petroleum products, with coffee, gold, and cacao also important. Most of the petroleum export was to Curacao, with the United States second.

**Production.**—Venezuela is the world's third largest producer of petroleum, with an output for the year ending Oct. 31, 1937, of 175,156,393bbls., over 8% of the world total, against a 1936 production of 153,314,971 barrels. Taxes derived from petroleum comprise approximately a third of the national revenue. The chief agricultural product is coffee, yielding about 125,000,000lbs. annually, 30% of which is exported to the United States. Cacao to the value of 6,774,543 bolivares was produced for export in 1935. Cattle and goats are important resources, providing a valuable hide and skin export. The monetary unit is the bolivar (value: 31¢ U.S.). Venezuela has no external or internal debt. The 1937 budget totalled \$55,044,555.

**Education.**—Compulsory primary education under federal control is provided by law. The school system has been in a thoroughly disorganized condition. A concerted drive for betterment, under direction of Chilean and other foreign educators, was begun, however, by the present Government late in 1936, and the 1937 budget allotted \$4,348,770 (8%) for education.

Venezuela has compulsory military service and a small navy for coastline protection. (L. W. BE.)

**Vermont**, fourteenth State of the United States, first to be added to original thirteen, popularly known as "The Green Mountain State"; area, 9,564 sq.mi.; population according to the U.S. census of 1930, 359,611, with slight increase since, both urban and rural. Capital, Montpelier, 8,000. Largest city, Burlington, 25,000. Of the State's population 118,766 are urban, or 30%; 358,965 whites; 568 coloured; 315,904 native-born; 43,061 foreign-born.

**History.**—Vermont was one of two states to vote a Republican ticket in the last, 1936, presidential election.

During 1937 it passed an Unemployment Compensation law and increased its Old Age Assistance from \$250,000 to \$475,000 annually. It also passed a number of bills bringing its crime legislation into harmony with other states, and entered into an interstate compact for flood control with neighbouring states. The State park system was expanded. Winter sports were strongly promoted. New airports were constructed. The motor vehicle patrol was increased. Much original work was done in popularizing town reports. An \$800,000 bridge was built across the northern end of Lake Champlain. The state is making plans for a 150th anniversary celebration in 1941. The governor is George D. Aiken; and William H. Willis is lieutenant-governor; Rawson C. Myrick, secretary, and Thomas H. Cave, treasurer.

**Education.**—The public school system of the State is under the supervision of a state commissioner of education and local union superintendents, the revenues being derived mainly from state and local taxes. A plan for equalization of educational opportunity is being worked out. Vocational training is at present confined largely to agriculture and home economics. School buildings and equipment are being improved and teacher courses and requirements strengthened. There are several institutions of higher learning.

**Charities.**—The charitable and corrective institutions consist of a state prison and women's reformatory, industrial school, two hospitals for the insane, a school for feeble-minded and a home for children. A commission, appointed to study the needs of these institutions, has recommended the expenditure of \$442,061 in improvements, which have begun.

**Finances.**—The total revenue from all taxes during the fiscal year ending June 30, 1937, was \$2,945,852, representing a net gain of \$143,961.20. The income tax revenue contributed the largest amount, \$697,976.78. The principal tax gains were from income, beverage and electrical energy taxes; the losses, from inheritance, railroad and insurance company taxes. The new taxes, chief of which was the cigarette tax, totalled \$91,255.23. There was a reduction in the State debt of about \$500,000 and the treasury showed a surplus. The financial situation in the state was unusually good. The banks operated under a unit plan of Federal Deposit insurance. Saving deposits, however, did not come back as rapidly as in many states.

**Industries.**—The number of industries in the State increased during the year, and there was little labour trouble. Milk trou-

GEORGE D. AIKEN, governor of Vermont

## VERMONT—VETERINARY MEDICINE

bles absorbed the interest of farmers and price equalization was sought. A new state milk control act was passed and a milk commission is making a study of the New England milk field. More than 1,000 acres of the new soy bean crop were harvested. The important maple sugar crop was small, but the state's mining industries, headed by marble, granite, slate, asbestos and talc, showed increased activity. (L. W. D.)

**Versailles Treaty:** see GERMANY: *History*.

**Veterinary Medicine.** Problems in which veterinary medicine and human medicine have a common interest are primarily those dealing with diseases transmissible between animals and man.

Tuberculosis eradication in cattle has been vigorously advanced in the United States since 1917. At the close of 1937, 45 of the 48 states in the United States will be officially accredited. In order to be accredited the cattle of a state must show an incident of tuberculosis of  $\frac{1}{2}$  of 1% or less. To achieve this coveted goal more than 178,139,976 cattle have been subjected to the tuberculin test. During this period, 1917 to 1937, respiratory tuberculosis in man has decreased from 124.6 to 49.8 and other forms from 22.5 to 5.2 per 100,000 population. The extent that the eradication of tuberculosis in cattle is responsible to the decrease in man is a subject for careful analysis. Recent investigations show that perhaps all cases of spontaneous tuberculosis in sheep are caused by the avian type of tubercle bacilli.

Studies in the control of Bang's disease in domestic animals is being vigorously pushed forward in nearly all states in the United States on a large scale. Copulation experiments conducted by infecting the prepuce of the bull with cultures of *Br. abortus* definitely show that the disease can be transmitted to the female by copulation. Ellenbogen, Hebrew university, Jerusalem, finds that Syrian hamsters are more susceptible to *Br. abortus* than guinea pigs, therefore, more desirable for testing for that disease because spleen lesions (*splenomegalia*) develop as early as seven days after culture inoculation.

Much attention has been directed to the study of parasitic diseases especially those transmitted to man. During 1937 trichinosis was perhaps the most important of those diseases brought to the attention of the veterinarian. Hall of the United States Public Health Service claims that approximately 17.5% of the population of the United States are infested with trichinae. At once this health problem becomes a problem for the veterinary profession to which rightly belongs the field of production and inspection of meat. It is now known that the principal source of trichinae is not infested rats but infested raw pork scraps fed in garbage. Hall claims that 5% of garbage-fed hogs are infested with trichinae. On the basis of this data hog raisers have been advised to cook all garbage before feeding.

Much research in the past year has been done on equine encephalomyelitis of virus origin. While the disease is not transmissible to man, results in the horse show that prophylactic vaccination and serum treatment show promise. Spirochetal jaundice (Weil's disease) is receiving more than occasional notice. The infection is spread by rats, and investigators have shown that in some parts of the country as high as 33% of the rats are infected. The part that the dog plays in the transmission is an unknown factor, although it is commonly affected.

Much interest is taken in the control of mastitis in cattle. An improved medium for the demonstration of hydrolysis of sodium hippurate by haemolytic streptococci of bovine origin, which may be of practical significance in examining strains of streptococci in milk that is suspected in outbreaks of streptococci infection in man, has been reported. Susceptibility of

swine to the virus of human influenza has been reported. This may be of tremendous value in the control of human influenza. Important developments have been made in the hospitalization of pet animals as shown by the excellent hospitals and hospital staffs through the principal cities. Animal surgery has made wonderful strides through the general use of anaesthetics and the application of modern technics.

(L. E. DA.)

**Victoria**, a state of the Australian Commonwealth, lying in the south-east between latitudes 34° S. and 39° S. and longitudes 141° E. and 150° E., and occupying 87,884 square miles. The State governor, representing H. M. King George VI, is Lord Huntingfield, K.C.M.G. Population (March 31, 1937), 1,856,096, forming 27.2% of the population of Australia. Capital, Melbourne. The premier of a Country party Government is Mr. A. A. Dunstan.

**History.**—The general election was held on October 2. The resulting party strengths were as follows (previous strengths in parentheses): Country party, 20 (20); Labour 21 (18); United Australia party, 21 (24); Independents, 3 (3). The Country party resumed office with the support of labour. A revised constitutional reform bill has since been accepted by both Houses. It provides that the assembly may be dissolved if a bill passed by it is rejected by the Council. If the dispute between the two Houses then continues, the Council may be dissolved, and if it still refuses to pass the bill a final decision lies with a joint sitting of both Houses. Extra delay is required for constitutional bills.

The governor's speech at the opening of Parliament on Oct. 19, 1937, foreshadowed legislation prolonging the Financial Emergency (Mortgages) Acts, amending the law relating to companies and workmen's compensation, and touching, *inter-alia*, moneys held in trust, widows' pensions, fair rents, and the agreement for establishing an aircraft factory at Port Melbourne.

Good rainfall in the latter part of the year gave promise of a satisfactory season, and the economic trend continued upward (*see below*). Transport developments included the construction of a streamlined, air-conditioned train in the State Railways' workshops.

**Trade, Industry, and Finance.**—Production in 1935-36 was valued (gross), as follows: pastoral, £18,044,335; agriculture, £15,863,087; farmyard and dairy, £14,323,741; forestry, fishing, and trapping, £1,647,090; minerals, £1,793,649; total, primary production, £51,671,902 gross value, £44,335,774 net value; manufacturing production, £134,043,170 gross value, £54,043,690 net value. The percentage of unemployment among trade unionists was 9.6 in the second quarter of 1937, against 10.6 in the second quarter of 1936. Total unemployment in the state was estimated at 26,000 in Oct. 1937, a decline of 4,000 since the previous October.

The 1936-37 budget showed an actual surplus of £21,000, instead of an estimated deficit of £110,000. Revenue for 1937-38 was estimated at £25,162,000 (against £25,116,000 received in 1936-37), and expenditure at £25,151,000 (against £25,095,000). Increases of expenditure or losses of revenue in 1937-38 were ascribed to higher wages and shorter working hours (cost, £350,000), cessation of the Commonwealth special grant (£137,000), an extra three months' cost of restoration of salary cuts (£123,000), heavier railway renewals and maintenance charges (£350,000), and falling-off of a Probate Duty (£115,000). The main charge in taxation was a cut of 20% in the rates of unemployment relief taxation, at a cost of £320,000. These adverse budgetary factors were offset by an estimated increase of £240,000 in the yield of income-tax, and by other revenue gains. Both expenditure and revenue totals were reduced by the cessation

of subsidies to the railways for losses on non-paying lines and reductions in freight charges. An Act of 1936 had provided for this and for a compensating reduction of £30,000,000 in the railways' capital liabilities.

(H. V. H.)

**Vie Femina Heureuse Prize:** *see* LITERARY PRIZES.

**Vienna**, the capital and chief city of Austria. Pop. (1934): 1,874,130. The population shows a slight but steady decline. The industry and banking of Vienna have passed through very difficult times, although as a tourist centre it more than holds its own. Constituted after the War a separate province of Austria, Vienna was reduced in 1934 to the position of a media-tized city, whose burgomaster, however, holds a seat on the Austrian federal council, equally with the eight provincial gov-ernors.

Vienna was the scene of heavy street fighting in Feb. 1934, when many of the great workmen's tenements erected by the Social Democrat Party were severely damaged by shell fire. The Social Democrat Party having been dissolved, a great change came over the administration of the city, which had formerly been in the hands of that body.

**Virginia**, one of the original states of the United States, popularly known as "The Old Dominion"; first settled permanently in 1607; area 42,627 sq.mi.; population accord-ing to U.S. census of 1930, 2,421,851; estimated July 1, 1937, 2,706,000; capital, Richmond, 182,929; seaport, Norfolk, 129,710. Of the state's population in 1930, 785,537 were urban, or 32.4%; 1,770,405 white; 650,165 coloured; 1,746,585 native white; and 23,820 foreign born.

**History.**—On Jan. 1, 1937, the leading state officials were: governor, George C. Peery; lieutenant-governor, James H. Price; attorney-general, A. P. Staples. An unemployment compensation bill, a soil conservation act and other liberal measures were passed by a special session of the general assembly, Dec. 1936. In the Democratic party primary election of Aug. 1937, lieutenant-governor James H. Price was nominated over Vivian Page for governor; Sax-on W. Holt, over Robert W. Daniel for lieutenant-governor; and attorney-general A. P. Staples, re-nominated. These nominees were elected in the usual Democratic victory which won 94 of 100 seats in house of delegates.

JAMES H. PRICE, elected governor, 1937

**Education.**—The state has a free school system for children from seven to 20, inclusive, which is compulsory for all between seven and 15 years. Physical training is obligatory; whites and Negroes have separate schools. The school census of 1935 recorded 731,043 children between seven and 20; 587,486 were enrolled in the public schools in the 1936-37 session, for which total disbursements were \$25,747,668.80 at per capita cost of \$43.83; length of school year, 170 days; 16,825 teachers were employed at average salary of \$841; the school property was valued at \$73,689,633. State expenditures for all educational purposes for the fiscal year ending June 30, 1937, were \$16,904,-

510.59, 23.63% of the total state expenditures. The state supports 10 institutions of higher learning in which, for the 1935-36 session 22,493 were enrolled.

**Charities and Corrections.**—The following institutions are under direction of the commissioner of public welfare: hospitals for insane, epileptic, and feeble-minded; tuberculosis sanatoria; schools for deaf and blind and commission for blind; Lee Camp for Confederate men and women; charity cases in University and Medical College hospitals; penitentiary; farm; convict camps; jails; industrial schools for juvenile delinquents; detention homes and boarding homes for State wards; children's bureau; and farms for female delinquents. The State also subsidizes in part the Home for Incurables and the Traveler's Aid Society.

The general assembly of 1936, for the first time, made State relief funds available for destitute persons. Before that poor relief proper in Virginia was financed and administered by local county and city Governments. The Public Assistance Act of 1936 strengthened the local relief systems in that it required their reorganization that they might qualify for State funds. Determinable on a basis of population, the general assembly allocated \$950,000 for local relief purposes for the year ending June 30, 1937. Local units had to provide funds amounting to 60% of any State funds which they were granted. Application of 91 counties and 23 cities for \$806,969.04 was approved and was matched by local funds of \$484,541.34, making the total amount available \$1,291,510.38. Total State expenditure on public welfare for same year was \$4,432,851.20, 6.19% of total State expenditure.

**Banking and Finance.**—At the beginning of 1937, Virginia had 191 licensed State banks and 132 national banks. Total assets of State banks \$255,190,000; of national banks \$404,811,000; combined total assets \$660,001,000. Combined liabilities of State and national banks included aggregate deposits of \$573,311,000, capital stock of \$46,573,000, surplus of \$21,781,000, and net undivided profits of \$4,762,000. On June 30, 1937, the balance in the State Treasury was \$10,728,340.09; the bonded debt, \$22,608,151.20; and the sinking fund, \$5,005,239.23. The State had no floating debt. On April 30, 1937, the assessed valuation of all property in the State was \$2,398,647,388; the total value of real estate assessed for local taxation, \$1,141,358,157. Revenues and expenditures for fiscal year ending June 30, 1937 were \$78,823,888.12 and \$71,614,335.89, respectively.

**Agriculture, Manufacturing, Mining.**—The total acreage harvested in 1936 was 3,693,700; value of all crops, \$107,075,000; value of livestock including poultry, \$57,140,000. For the same year, 2,475 manufacturing plants reported to State Department of Labor and Industry an output valued at \$902,348,968. Leading products were tobacco, textiles, transportation equipment, food, paper and printing, chemicals, and wood. The 75 coal mining and coke plants reporting in 1936 had an output valued at \$20,185,511; while 71 other mining and quarrying plants reported a product amounting to \$6,957,387. (J. S. Br.)

## Virginia, University of.

A State institution for higher education situated at Charlottesville, Va. The original university was designed and built by Thomas Jefferson. There are six departments; two academic—the college and department of graduate studies; and four professional—law, medicine, engineering and education. The institution has a productive endowment fund amounting to \$11,000,000, and receives from the State an annual appropriation of \$500,000. The total budget for 1937-38 was \$2,300,000. The corporate name of the university is "The Rector and Visitors of the University of Virginia." In 1937 the faculty and officers numbered 269, the students 2,681 (2,594 men and 87 women), and the number of volumes in the library 290,000.

The most significant developments in 1937 were the inauguration of new requirements for the cultural undergraduate degrees in the college; a new series of buildings to house the department of engineering, constructed at a cost of \$425,000; and the beginning of construction of a new library building to house the general library of the university, at an estimated cost of \$950,000.

(J. L. N.)

**Virgin Islands,** a United States West Indian dependency east of Porto Rico, comprising St. Croix, St. Thomas, St. John, and smaller islands; language, English; capital, Charlotte Amalie (formerly St. Thomas); governor, Lawrence W. Cramer. The area is 133 square miles. Population (census, 1930), 22,012 (a decrease of almost 16% since 1917 and less than half the early 19th century total), and is largely negro and mixed. The principal cities are Charlotte Amalie (St. Thomas), 7,036, and Christiansted (3,767), and Frederiksted (2,698) on St. Croix. Under the Organic Act of the Virgin Islands of 1936, government is administered by a governor appointed by the President of the United States, and an elected legislative assembly. Developments in 1937 were featured by efforts to organize the government under the Organic Act and to continue the economic rehabilitation begun in 1934. The political agitation which had preceded the Organic Act continued when the first legislative assembly met in November, and culminated in a spectacular dispute between the governor and the assembly, with their respective rights. Economic development largely through public works was such that, by mid-year, unemployment was virtually eliminated on St. Croix and materially reduced elsewhere. This was chiefly the result of Federal expenditures, but the development of the rum industry and the tourist trade and a policy of homestead allotments helped. Improvement of the harbour of Charlotte Amalie at a cost of \$743,000 and extensive dock construction was recommended by the governor. The islands were formerly an important commercial and coaling centre, but now depend primarily on sugar, although the development of other assets is being stimulated, especially through the Federally-controlled Virgin Islands Co. In the year ending June 30, 1937, imports were \$3,819,618 (foodstuffs, 23.2%; fuel oil, 20.9%; machinery and vehicles, 11.5%), with 67% from the United States, 13% from Curacao; exports were \$1,040,687 (64.5% sugar and rum), 94% to the United States. Sugar production is limited by quota to 5,000 tons annually. For the fiscal year 1936-37 Federal contribution to insular expenses was \$130,000, a reduction of \$35,000. Public school enrolment in 1936-37 was 3,249. Annual expenditure for education is approximately \$105,000. Over 90% of the population is literate. (L. W. Be.)

**Vital Statistics:** see BIRTH STATISTICS; DEATH STATISTICS; DIVORCE; INFANT MORTALITY; SUICIDE STATISTICS.

**Vitamins.** The known vitamins are designated respectively: A, B<sub>1</sub> (or B), B<sub>2</sub> (or G), C, D, and E. Four (B<sub>1</sub>, B<sub>2</sub>, C, D) have now been chemically isolated, together with the natural precursor of another. All are determinants of normal physiological activity, each having its own specific functions. All are present in natural foodstuffs, on which, and not on commercial vitamin-concentrates, man should ordinarily rely for his supply.

**Vitamin A** (C<sub>20</sub>H<sub>30</sub>O) is derived directly or indirectly from the carotene pigments of plants.

**Principal sources:** green and yellow vegetables, fish-liver oils, egg yolk, milk, butter, cream, and cheese.

**Functions:** promotes growth; necessary for reproduction; preserves structure and functions of epithelial tissues; maintains resistance to infection.

*Effects of deficiency:* failure of growth, interference with ovulation, night-blindness, dry skin, "toad"-skin, and infections of eye, nasal passages, throat, lungs, stomach, intestines, skin, urinary tract, and (in females) reproductive tract.

**Vitamin B<sub>1</sub> (or B).** Aneurin ( $C_{12}H_{16}N_4OS$ ).

*Principal sources:* yeast, whole cereals, legumes, nuts, green vegetables, eggs, cheese, fish-roe, kidney, liver.

*Functions:* necessary for carbohydrate metabolism and neuromuscular efficiency.

*Effects of deficiency:* lack of appetite, impaired growth or loss of weight, poor digestion, sluggish bowel-action, cardiac disorder, fatigue, nervousness, neuritis, disturbed lactation, beri-beri.

**Vitamin B<sub>2</sub> (or G),** ( $C_{17}H_{20}N_4O_6$ ); belongs to the flavin group of pigments.

*Principal sources:* yeast, milk, green vegetables, lean meat, liver, kidney.

*Functions:* helps to sustain health of skin, mucous membrane of alimentary tract, and nervous system.

*Effects of deficiency:* failure of growth, sore tongue and mouth, skin lesions, gastro-intestinal inflammations, pellagra.

**Vitamin C.** Ascorbic acid ( $C_6H_8O_6$ ).

*Principal sources:* citrus and other fruits, raw vegetables, red pepper, milk, liver.

*Functions:* reducing agent, playing part in tissue-respiration; preserves tone of blood capillaries; enables cells to form their intercellular cement substance.

*Effects of deficiency:* haemorrhages, sallow skin, imperfect dental structure, fragile bones, swelling of joints, unhealthy gums, gastro-intestinal disorder, latent or manifest scurvy, lowered resistance to infection.

**Vitamin D.** Calciferol ( $C_{27}H_{42}O$ ); obtained from irradiated ergosterol.

*Principal sources:* direct insolation or artificial irradiation of human body, fish-liver oils, egg-yolk, butter, liver, kidney, irradiated foodstuffs containing ergosterol.

*Functions:* regulates calcium-phosphorus metabolism; maintains calcium and phosphorus levels in blood; fixes calcium in bones and teeth.

*Effects of deficiency:* defective bone and tooth formation, fragility and softening of bone, bone deformities, rickets, dental caries, tetany, muscular weakness, difficult labour due to deformed pelvis, tendency to respiratory disease, chilblains.

**Vitamin E.** Chemical structure not definitely known.

*Principal sources:* wheat-germ oil, whole cereal grains, lettuce, watercress, molasses, vegetable oils.

*Functions:* maintains placental function in females and germ cell maturation in males.

*Effects of deficiency:* sterility, foetal death, habitual abortion. (See also CHEMISTRY: *Vitamins*; CHEMISTRY, APPLIED; DIETETICS; FLOUR AND FLOUR MILLING; SOAP, PERFUMERY, AND COSMETICS.)

(R. McC.)

## Vocational Education,

which may be defined as that form of education which prepares persons for useful employment, has made definite progress during the year 1937. One cannot view carefully the whole field of education in the United States, particularly on the levels below that of professional training, without realizing that the vocational aspects are receiving increased attention from the educator and the general public. An increasing consciousness of the need for improved and more numerous vocational education offerings is distinctly noted in many sections of the country. Programs curtailed during the depression are being restored to previous levels, and definite growth in enrolment of students and in range of courses offered is found throughout the United States.

Perhaps the outstanding event in vocational education during 1937 was the increased Federal subsidy under the George-Deen Act which became effective on July 1, and which more than doubled the amount of aid to the states on the part of the Federal Government. Supplementing the aid already available under the Smith-Hughes Act of 1917, the George-Deen Act added more than \$14,000,000 of annual subsidy available for vocational education. While the Federal aid under the Smith-Hughes Act provided for training in agriculture, home economics, and trades and industries, the new act goes farther in its scope and includes the distributive occupations. Greatly enlarged programs are noted in the fields of work previously subsidized, and substantial beginnings are found in retail selling training and in other phases of the distributive occupations.

New building programs for industrial education are in evidence in several cities, notably New York and Philadelphia. In many places also one finds new courses developed to meet training needs in newly developing fields such as Diesel engines, air-conditioning and the electronics industry. Organized courses appeared during the year in training for public service occupations such as police service, fire fighting, and motor vehicle inspection.

Significant also is the increase in educational offerings on levels below and above that of the skilled trades. Training courses for technicians on a level above that of the skilled trades and below that of the engineering college, prevalent in many European countries but found in few places in the United States, are receiving increased interest and are appearing in scattered areas. Many of the industrial schools have added courses for the training of semi-skilled operatives, below the skilled trades level.

Apprenticeship training programs operated by industrial plants, or as a part of the public school system, have seen some growth, although this has been slow. The Federal Committee on Apprenticeship Training has been active in promoting apprenticeship and in the development of standards for apprentice training. Vocational courses for out-of-school youth have received increased attention. The Federal emergency agencies dealing with youth, particularly the Civilian Conservation Corps and the National Youth Administration, have been active in carrying on and in stimulating such training programs, and many municipal and State educational departments are working toward a better solution for this important problem.

The year 1937 has been a year of progress for vocational education in the United States. Much has been added to the vocational offerings available to youth and adults, but perhaps more significant is the amount and quality of attention which is being given to the problems of vocational education by the educators of the nation; Federal, State and local.

(L. A. E.)

**Vocational Guidance.**—The purpose of vocational guidance is to discover the fitness of individuals for various occupations, and to give suitable advice. It may profitably be contrasted with vocational selection, the aim of which is to advise employers concerning the relative merits of various candidates for employment, promotion, or training. Both these procedures utilize tests, questionnaires, and interviews, but have different objectives. In vocational guidance, the chief aim is to satisfy the applicant; in vocational selection, the employer. This leads to a difference in technique, since most individuals seeking vocational guidance voluntarily reveal many of their defects, while in vocational selection, this frankness cannot reasonably be expected.

The vocational adviser's aims are: (1) to collect all data relevant to the particular vocational problem of the individual concerned; (2) to impart, in language suitable to the candidate, the relevant knowledge; (3) to interpret the data about the candidate in the light of the adviser's knowledge of requirements and opportunities in the professions and trades; (4) to formulate

suggestions to the candidate or his parents; (5) to persuade them to accept an apparently desirable course of action.

The adviser surveys the candidate's financial, social, geographical, and other circumstances, his bodily make-up, dress, speech, and manners, his level of intelligence, his special aptitudes, abilities, and interests, and compares these data with special reports about the demands upon the candidate's abilities likely to be made by different occupations. Variations between the techniques of different vocational advice organizations (in the United States and Britain at least), are, comparatively speaking, not great.

Most tests are intended to investigate general intelligence or certain special aptitudes; e.g. mechanical ability. Tests for interests and dispositions are easy to devise, but difficult to interpret at present. Many experienced advisers use tests with great discretion, regarding them as very valuable supplements to information obtained in more direct form. It is important to emphasize this point, since some sweeping assertions which have been made about the success or failure of vocational guidance are really about the success or failure of the tests taken by themselves.

Psychological methods for vocational guidance are extensively used in the United States, Great Britain, Germany, France, U.S.S.R., Switzerland, Italy, Spain, the Scandinavian countries, Holland, Belgium, Australia, Africa, China, Japan. Obviously, the different political, economic, and other aims and ideals of these countries determine, to a certain extent, the aims and methods of vocational guidance used in them. Considering the relative newness and heterogeneous personnel of the vocational guidance movement, the work is already well documented, especially in the book by Keller and Viteles. (See also EDUCATION.)

**Vocational Guidance:** see VOCATIONAL EDUCATION: *Vocational Guidance*.

**Wages and Hours.** The substantially higher level than in 1936 of economic activity in the United States during the first 10 months of 1937 brought employment

and payrolls in manufacturing and most of the non-manufacturing industries well up toward 1929 levels. The percentage increase in manufacturing payrolls in 1937 over 1936 was nearly twice as great as the percentage increase in employment (see Table I), due mostly to widespread increases in wage rates. The U.S. Bureau of Labor Statistics reported in August 4,250,000 people had received wage increases between Oct. 15, 1936, and June 15, 1937.

This number included some wage earners who had received more than one wage raise.

The increases in hourly earnings referred to were due to three principal factors, the rising cost of living, the increased demand for labour, and, most important, the rapid growth and increased pressure of labour unions.

The following are typical illustrations. Between August 1936 and August 1937 employment in manufacturing industries as a whole increased 9.4% and payrolls 24.3%, while average hours per week decreased 1.9%. In the iron and steel industries the changes were: employment +14.1%, payrolls +38.7%, weekly hours -3.1%; in the furniture industry, employment +9.2%, payrolls +15.7%, hours -6.7%; in textiles, employment +1.0%, payrolls +5.4%, weekly hours -6.5%; in food products, employment +4.0%, payrolls +13.9%, hours +3%; in tobacco manufactures, employment -1.9%, payrolls, +6.9%, and hours -1.7%; and in automobiles, employment +20.7%, payrolls, +38.3%, and weekly hours, -4.4%.

Turning to the non-manufacturing industries, we find a similar story. In anthracite mining average hourly earnings were 9.9% higher, and in bituminous they were 12.0% higher in August 1937 than in August 1936. In metalliferous mining the increase in hourly earnings was 17.7%; in quarrying, 13.8%. In wholesale trade it was 6.1%; in retail trade, 7.6%; in hotels, 7.7%; laundries, 6.2%; and the building industry, 15.2%. Of the more than a hundred industries whose wage statistics are tabulated by the U.S. Bureau of Labor Statistics only millinery manufacturing showed lower hourly earnings in August 1937 than in August 1936. The decline of 7.1% in that industry accompanied a decrease of 10.4% in employment and 16.4% in total payrolls. In 1937 it was a declining industry.

The range in wage increases in all industries other than millinery was from an increase of 1.6% in hourly earnings on steam railroads where wages were already at high levels in 1936, to an increase of 28.9% in blast furnaces. The typical increase in hourly earnings was between 10% and 25%, while hours per week typically decreased, nearly all of the exceptions being industries which were working below their usual weekly schedule, such as agricultural implements, machine tools, the transportation industries (both the operating and manufacturing divisions, except automobiles and aircraft), and manufacturing silverware, which increased up to approximately their usual weekly hours.

The picture is different for the last two months of 1937. The rapid recession of business and employment which threw more than a million people out of work between October 1 and the end of the year checked further wage increases, and reduced weekly earnings of those employed in many of the industries by reducing hours of operation.

Table I gives the index numbers of employment and payrolls in the manufacturing industries, and compares 1936 and 1937 by months. The greater increases of payrolls than of employment is shown throughout the table.

The "all manufactures" employment index for 1937, 11 months, (100.3) may be compared with the 1929 index of 104.7, the 1937 payroll index, 99.5, with 109.1, in 1929.

Table II shows the average hours worked per week, earnings per hour, and weekly earnings in the principal industry groups of the

**SEARCY**  
BUSINESS RECESSION viewed as an "unsightly defect in the winter landscape" by Jensen in the *Chicago Daily News*

# WAGES AND HOURS

707

United States for the months of February, June and August, 1937. February was selected because less affected by the Christmas season and January inventories. June shows the mid-year situation and is typical of the hours and wages situation reached in 1937. August was the most recent month for which detailed figures were available. Very little change occurred between June and August. When the figures for November and December are available they will show, probably, some decrease in average weekly working hours and average weekly wages due to the sharp recession which occurred during those months.

In June 1937, there were six industry groups in which the average hourly earnings were between \$.90 and \$.971 per hour. The highest average earnings obtained in the printing of newspapers and periodicals. The other high wage industries were rubber tires, petroleum refining, the building trades, anthracite mining, and automobile manufacturing. There were nine industries with average earnings of \$.803 to \$.89 per hour, including such widely different lines as bituminous coal mining, blast furnaces, calculating machines, beverage manufactures, and electric light and power plants. About half of the industries of the country paid average wages from \$.60 to \$.80 an hour; 21 industries between \$.50 and \$.598; and 12 were below \$.50 an hour.

The worst earnings were in cottonseed oil and cake mills, where the average wage was but \$.251 per hour. This is largely southern negro labour. Men's furnishings paid but \$.355 and "shirts and collars" but \$.393. A great deal of female labour is used in these industries.

The other industries in this "less than \$.50 an hour" group ranged between \$.42 and \$.48 an hour, including such important branches of manufactures as cotton textiles, silk and rayon, butter and cheese making, confectionery, cigars and cigarettes, and fertilizers. The \$.50-\$.60 an hour group included a particularly large number of consumers' goods industries, e.g., boots and shoes, baking, flour milling, furniture, clocks, radios and phonographs, knit goods, woollens and worsteds, and ice cream manufacturing.

The average earnings of wage earners employed in factories during the summer of 1937 had higher buying power than the average wages of 1929. The index number of retail food prices in July 1937 was 85.9; in July 1929, 106.5 (1923-25=100). The wholesale price index number was substantially lower for all

Hotels (year-round) . . . . .	48.2	47.7	47.3	.290	.307	.311	14.44	14.83	14.86
Building . . . . .	31.7	33.8	34.7	.874	.925	.930	27.83	31.25	32.28

classes of commodities tabulated by the Bureau of Labor Statistics except building materials, and retail prices are based upon these wholesale prices. Average weekly earnings for 1929 were \$26.30; for February 1937, \$24.37; for June \$26 and for August \$25.89. In each of these months the purchasing power or average wages exceeded that of 1929. But there were wider discrepancies in welfare between individual wage earners, and also industry groups in 1937 than in 1929. The nearly 3,000,000 (on the average) people employed on public works of an emergency character averaged far lower weekly earnings than they earned in 1929. The coal miners had less employment than in 1929, and their annual earnings were unquestionably down more than was the 1937 cost of living compared with 1929. Manufacturing, transportation, mining and construction were not giving employment to as large a proportion of the population as in 1929. It is easy, therefore, to be misled by the statistics showing higher "real wages" for those earning month by month in 1937 the average weekly earnings characteristic of the year.

Another point should be noted in this connection. After calling attention to the wide variations in both hours and earnings

which are found within each industry, both geographical variations and establishment variations, the United States Bureau of Labor Statistics pointed out that "there are indeed few industries that do not have submarginal fringes which create problems of a serious nature." (*Monthly Labor Review*, November, 1937, p. 1060.)

The wages of farm labour were about 15% higher in 1937 than in 1936, judging by the reports of the U.S. Bureau of Agricultural Economics. Monthly wages, with board, averaged \$25.28 in July 1937, and \$22.07 in July 1936; daily wages with board \$1.34 in July 1937, and \$1.15 in 1936. (D. D. L.)

**Great Britain and Europe.**—In Great Britain money rates of wages over industry as a whole have varied comparatively little in recent years. The effect of the world depression had been, by 1933, to reduce the general average of wage-rates by about 5% below the level of 1929. These reductions had been approximately cancelled by the end of 1936; and in 1937 wage-rates rose slowly to 4 or 5%, on the average, above the 1929 level by the end of the year. These figures, however, take no account either of changes in the cost of living or of variations in actual earnings in times of good and bad trade. Nor do they take account of the effects of the migration of workers to different employments, which may be better or worse paid; but this factor, important in the long run, is not very significant over short periods.

During the world depression prices fell very greatly, and the prices of foodstuffs were especially affected. This reacted on the cost of living, so that real wages for full-time employment rose substantially, even when money wages were being reduced. They were actually 11 or 12% higher in 1933 than in 1929. But in the recovery, especially from 1936, the cost of living rose faster than money wages, so that by the autumn of 1937 real wages for full-time work had been appreciably reduced. By November the cost of living was 60% above the level of 1914, as compared with 36% in the middle of 1933.

As against the fall in the purchasing value of wage-rates, employment had improved, so that there were more workers in employment and a larger proportion of them working a full standard week, or even overtime. The effect of these changes cannot be statistically measured, but they were considerable in certain trades, at any rate until the autumn, when some tendency to recession appeared (*see* LABOUR). Approximately the workers in Great Britain were probably, on the average, from 6 to 7% better off in purchasing-power at the end of 1937 than in 1929. This, of course, does not apply to South Wales, or other depressed areas.

Over the world as a whole, price changes have played an important part in varying during the last few years the level of real wages. There is great difficulty in securing comparable statistics for different countries, either for money wages or for the cost of living; and, both absolutely and comparatively, the figures in the accompanying tables should be regarded as only approximate. In respect of money wages, some countries compile their figures in terms of wage-rates, and others in terms of actual earnings. Figures of hourly earnings can, however, be treated as roughly comparable with figures of rates. Measurements of the cost of living differ considerably in scope, some being based mainly or exclusively on food prices, whereas others take account of rent and other forms of expenditure. In the two tables dealing with money and real wages, the figures used are those cited by the International Labour Office as reliable enough to be used for approximate comparisons.

It will be seen that, by 1932, money wages had been reduced in most countries included in the table, but that there had been small increases in France and Scandinavia, and a very large increase in the U.S.S.R. Real wages for full-time work had, however, risen in all these countries (except that no measure of real

Table III—Money Wages—Index Numbers

Denmark . . . . .	114	105	105	103 (March)

wages is possible for the U.S.S.R.). By 1936 money wages had regained the pre-slump level in Great Britain, and advanced beyond it in the United States, and a long way beyond it in France. In Scandinavia there had been little change; and wages were still much below the 1929 level in Germany, Italy, and Japan. In terms of real wages, France and the United States made the best showing, with advances of more than 20% above 1929, and Great Britain and Sweden also showed considerable advances. In Germany, on the other hand, real wages (even apart from the shortage of actual supplies at the controlled prices) were still below the 1929 level, and in Japan there had been a much larger fall.

It is difficult, with the figures so far available, to say much about the developments in various countries in 1937. In the United States there were considerable wage-advances in the early part of the year, involving large gains in real wages. Italy, too, shows a rapid rise, which is not very easy to account for in face of a large rise in prices. On the other hand, in both Great Britain and the Scandinavian countries there was undoubtedly some tendency in 1937 for real wages to decline.

In recent years, hours of labour in Great Britain have been subject to very little change. Standard hours of labour in most manufacturing industries are 47 or 48 per week—47 in the engineering, and 48 in the textile trades, for example. Coal miners work a shift of seven and a half hours, plus one winding time, averaging a further half-hour. Dockers work an eight-hour day, and railwaymen a 48-hour week. Builders average, over summer and winter, from 44 to 45 hours a week. Municipal employees vary from 44 to 48 hours. All these figures are exclusive of overtime, which is usually paid for at a higher rate.

In the United States the working week was, until the New Deal, usually longer than in Great Britain. It is now in most trades definitely shorter. The 40-hour week has been established in a large number of industries, including building, engineering, and printing; and some trades (*e.g.* bakers and furniture workers in New York) work only 35 hours. On the other hand, hours are not uniform over the whole country; and transport workers mostly work 45 or 48 hours.

In France, until 1936, the 48-hour week was in force in the majority of industries; but in 1936 and 1937 the 40-hour week was applied by decree to most of the major occupations as a result of the great strike movement of 1936. When the Blum Government was replaced by that of M. Chautemps in 1937, the employ-

ers, supported by some of the Radicals in the Cabinet, demanded a reversal of the Blum decrees; but in face of strong resistance from the trade unions and from the Socialist members of the government, only minor modifications had been made up to the end of the year. These, for the most part, do not withdraw the 40-hour week, but only introduce greater elasticity into its working (*e.g.* on the railways).

Of other important industrial countries, Sweden and Denmark, and also Switzerland, Holland, and Belgium work mainly a 48-hour system, with shorter hours in certain trades. In Poland the standard hours vary by district from 46 to 48. Canadian hours vary greatly, both by trades and by areas, with from 44 to 50 hours as the most usual limits. Australia has for most organized trades a 44-hour week; but some transport workers work 48 hours. New Zealand has established a 40-hour week in many trades. No statistics are available for normal hours in either Germany or Italy.

The standard hours of labour differ considerably in certain cases from the average hours per week actually worked. In the United States in 1937 actual factory hours averaged from 39 to 41 per week, and in France, despite the 40-hour week, two-thirds of the workers covered by official returns were actually working, on account of overtime, more than 48 hours. It is possible to give some figures of actual hours worked for countries which publish no statistics of normal hours. Thus in Germany, factory hours in 1937 averaged seven and a half per day, as against seven in 1932 and rather over seven and a half in 1929. In Italy, hours in 1937 averaged 166 per month, as compared with 182 in 1929 and 169 in 1932. In Japan, both in 1929 and in 1937, the usual factory hours actually worked were from nine and a half to ten per day.

The question of working hours, however, cannot be adequately considered entirely by itself. In Great Britain at any rate there has been in recent years a great average increase in the time taken in getting to and from work. This is an inevitable consequence of the growth of cities and of the spread of urban populations over a wider area. It constitutes, for many workers, a substantial addition to the length of the working day, and has added impetus to the movement for shorter working hours. But the employer, when he finds it necessary to yield to the demand for a shorter working week, naturally endeavours to check the consequent rise in costs by more intensive use of labour during the reduced hours of employment. The growing mechanization of industry makes this easier, by transferring the control of the pace of work increasingly from the individual worker to the machine—or the power plant. The worker must either adapt himself to the pace set by the machine, or seek other employment. Even when the pace cannot be determined in this way directly by the speed at which the machines revolve, a similar result can be secured by means of squad work, in which each individual must adapt himself to the pace of the group as a whole. These conditions of speeding up, closely associated in the workers' minds with the "Bedaux" and other systems of "efficiency engineering," have come to apply very widely in the industries engaged in mass-production of consumers' goods; and somewhat similar methods have been adopted extensively in coal-mining, iron and steel manufacture, and other basic industries. They give rise to frequent complaints that older men, on regaining a job after a long spell of unemployment, find themselves unable to stand the pace and the changed technical conditions of work, and often slip back into unemployment, and are discarded in favour of younger and more adaptable workers.

In view of these conditions of additional travelling time and greater intensity of labour, the shortening of the working week in most occupations since 1914 has not been unmixed gain. Never-

theless, it has considerably enlarged the workers' opportunities of leisure—for even if work has come to demand greater intensity of effort, the demand made on the worker is more often for nervous than for muscular energy, and does not result in the same sort of weariness at the end of the working day. This change in the character of the labour process, especially in the newer industries, may have a close connection with the increasing demand for amusement, of which there is evidence in the very rapid increase in the numbers employed in the amusement industries.

In general it has been found that, in the more highly mechanized trades, the reduction of the hours of labour has involved, in the long run, little or no increase in labour costs, or has even been accompanied by a reduction. It has, however, led to an increased adoption of the shift system, in order to spread the capital costs over a larger volume of output. Shorter hours have led to increased costs chiefly in trades concerned, not with production, but with the rendering of services, and, in the case of manufactures, in trades in which the state of demand has not permitted total output to be increased by the adoption of the shift system. Even in the services, however, it has sometimes—on the railways, for example—been found possible to make large economies in the use of labour, and by this means to counteract the rise in costs resulting from a shorter working day or week.

Wages and hours are, of course, closely associated; the employers' ability to pay wages being in practice conditioned by the number of hours for which he is able to keep his labourers at work, and also by the extent to which, especially in certain highly mechanized trades, he is able to spread his capital costs over a larger volume of output by means of the shift system.

The movement for the 40-hour week as a means of reducing unemployment received a considerable impetus during the world slump, and was taken up actively by the International Labour Organization. In face of the opposition of most of the employers' groups and of some Governments (including the British), an International Draft Convention laying down the principle of the 40-hour week was adopted by the I.L.O. in 1935; but this still remains unratified by any important State. Subsequently, more detailed conventions have been adopted, applying the 40-hour week to particular industries, and also proposing the reduction of hours to less than 48, but more than 40, in a number of other industries. But these also remain for the most part unratified by the States concerned. The British Government, despite trade union demands for a general 40-hour working week, has taken up the attitude that the question should be dealt with by separate negotiation between the employers and workers in each industry and not by general legislation.

Closely connected with the movement for a shorter working week is the demand for the general adoption of "holidays with pay." A draft convention providing for this reform was adopted by the I.L.O. in 1936, but has not been ratified so far by any country. But France, Belgium, and Norway passed in 1936 acts establishing the system on a compulsory basis; and the general enforcement of payment for holidays has been under consideration in a number of countries. There is provision for the system in both Germany and Italy; and in the U.S.S.R. it ranks as one of the "fundamental rights" laid down in the new Constitution of 1937. In other countries many collective agreements include the right to paid holidays, and there has been a considerable extension of the system during 1937. In Great Britain a bill for the compulsory establishment of paid holidays was carried by the House of Commons on second reading; and the Government thereupon set up a Committee to investigate the matter with a view to possible legislation. It was estimated officially in Great Britain that in 1936 about 1,500,000 wage-earners, as distinct from salaried employees, were already entitled to paid holidays under agree-

ment, the provision varying from 3 to 12 days, after from 6 to 12 months of continuous employment. Since then a large number of additional firms have conceded paid holidays in some form.

Undoubtedly the demand for "holidays with pay," which has been actively taken up by the Labour party, arouses general enthusiasm among the workers; and it seems fairly certain that payment for holidays will before long become a statutory right in Great Britain and most other industrial countries. (*See also LABOUR.*) (G. D. H. C.)

**Wake Island**, a possession of the United States of America, lies in mid-Pacific in lat.  $19^{\circ} 15' N.$ , long.  $166^{\circ} 38' 15'' E.$  It is about 2,130 miles W. of the Island of Hawaii and 1,290 miles N.E. of the Island of Guam. It has no native or permanent inhabitants and is a typical coral atoll of three small islets enclosing a shallow lagoon; total land area about 2,600 acres, much of which is from ten to fifteen feet above sea level.

The island was discovered by the British in 1796. Captain Wilkes, U.S. Navy, explored it in 1841 and Captain E. D. Taussig, U.S. Navy, in the "U.S.S. Bennington," took possession in the name of the United States in 1899. It is under the control and jurisdiction of the Navy Department, which has granted Pan-American Airways of the United States permission to establish and maintain temporary facilities on the island in connection with the commercial trans-Pacific flight operations of that company.

The island is non-productive and there are no commercial interests except those of the Pan-American Company. There are neither pandanus nor coco-nuts, but the higher parts of the land are densely wooded with shrub growing to a height of fifteen feet or more, and some of the tidal flats are covered with mangroves. There is no trace of igneous rock, the entire land being coral formations and sand. It is the nesting place of innumerable birds, including albatrosses, frigate birds, terns, boatswain birds and snipe, all of which are protected. (O. M. H.)

**Wales**, principality forming part of Great Britain, to the west of England and north of the Bristol channel, consisting of 12 counties, to which for administrative and statistical purposes Monmouthshire is usually added; governed as an integral part of the United Kingdom, it sends 36 members to the British Parliament. Capital, Cardiff.

**Area and Population.**—Area (including Monmouthshire); 8,016 square miles. Population (census 1931); 2,593,014 (density 323 per square mile). The leading cities are Cardiff, population (1931) 223,589; Swansea (164,797); Rhondda (urban district) (141,346). The language is English; but in 1931, 77,932 persons spoke Welsh only; 811,329 (31%) spoke both languages.

**History.**—There were no by-elections during the year, but a vacancy was created in the Pontypridd division of Glamorgan-shire by the death, on Nov. 25 of Mr. D. L. Davies (Lab.). On Jan. 19 three leaders of the Welsh Nationalist party, which seeks Dominion status for Wales, were convicted and imprisoned for setting fire, in the previous September, to an aerodrome at Penrhos, the erection of which they considered contrary to Welsh national interests.

**Education and Religion.**—(*See GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.*) The University of Wales, with colleges at Aberystwyth, Bangor, Cardiff, and Swansea, has some 360 professors, lecturers, etc., and about 3,200 students. The (Protestant Episcopal) Church of England in Wales was disestablished 1920, and reorganized as a separate archbishopric. It has 194,000 communicants. The Calvinistic Methodist (181,000 members) and Congregational Churches are the largest non-episcopal bodies.

**Walking.** In the walking world, the year 1937 has been distinguished by the breaking of every officially recognized world's record at metric distances from 3,000 to 25,000 metres. The outstanding walker has been J. Mikaelsson, Sweden, who made six new metric records and still holds five of them. He is 22 years of age, and made his first record by walking 5,000 metres in 21mins. 49 seconds. He then won the English 7mi. title in 50mins. 19.2secs., and followed that new mileage record up with further records of 3,000 metres in 12mins. 53.8secs.; 10,000 metres in 44mins. 8secs.; 15,000 metres in 1hr. 8mins. 37secs.; 20,000 metres in 1hr. 31mins. 47secs.; and 25,000 metres in 1hr. 57mins. 31.6 seconds.

Mikaelsson did not go through the season without suffering a defeat, and his 10,000 metres record has been eclipsed by Bruun, Germany, walking the distance in 43mins. 25.2secs., and Rundoif, Germany, 43mins. 54.6 seconds. Best performances, not constituting world's records, at other metric distances this year have been: 30,000 metres, Bleiweiss, Germany, 2hrs. 30mins. 46secs.; 50,000 metres, Segerstroem, Sweden, 4hrs. 31mins. 12secs.; 67,000 metres, Malmquist, Denmark, 7hrs. 5mins. 24secs.; 80,000 metres, Champion, France, 8hrs. 31mins. 47secs.; and 12,569 metres in 1hr. by Schwab, Switzerland.

Fifty thousand metres (31mi. 121yds.) is the official distance of the walking championship at the Olympic Games, which title was won in 1936 by H. Whitlock, Great Britain, in 4hrs. 30mins. 41.4secs., which is 30.6secs. faster than the time returned by Segerstroem. Whitlock walked 50,000 metres only once in 1937, when he won the R.W.A. title very easily. His time was 4hrs. 38mins. 43secs., which placed him fifth in the 1937 world rankings. But his record time for this distance was beaten on October 3 by the Alsatian, Sibert, who, during a walk from Dijon to Beaune, covered 50 kilometres in 4hrs. 24mins. 54 seconds.

**War, Munitions of:** *see* MUNITIONS OF WAR.

**Warburg, Felix M.** (1871–1937), American financier and philanthropist, was born of German Jewish parents in Hamburg, Jan. 14, 1871. Coming to the United States in 1894, he joined the banking firm of Kuhn, Loeb and Company, of which he ultimately became senior partner. He was naturalized in 1900 and in the years following became increasingly active in the field of social service. Among his interests were the Henry Street Settlement, the Playground Association, the Children's Courts, the Babies' Hospital, the Neurological Institute, the Loeb Home for Convalescents, the American Museum of Natural History, and the New York Association for the Blind. In the educational field, he served as a New York board of education commissioner and as a trustee of Teachers college as well as contributing generously to organizations devoted to Jewish education. He was especially interested in Jewish social work, being head of the federation for support of Jewish philanthropies established in 1917 and championing co-operation between agencies of varied faiths. While not a Zionist, he worked for a better understanding between Great Britain, Arabs and Jews and hoped Palestine might prove a Jewish cultural centre and a refuge for oppressed people of every race. Always interested in art and music, he was an active supporter of such projects as the Fogg Art Museum of Harvard university, the Museum of Science and Industry of New York city, the New York stadium concerts, the Institute of Musical Art, and the New York Philharmonic Society. He died in New York city, Oct. 20, 1937.

**War Debts.** At the end of the World War, twenty nations owed the United States \$10,338,323,597.20. Funding agreements with thirteen countries were reached during the years between 1923 and 1926 setting their debt with interest to that date at \$11,521,654,006 payable with interest charges over a period of 62 years. Of the others Cuba and Liberia paid their debts; no agreement was ever reached with Armenia, Greece, Nicaragua and Russia, and the Austrian debt was set at a flat \$34,159,106 payable in 1943. Payments were made under these agreements until 1931, since which time full payments have been made only by Finland and token payments made for a time by a few others were not continued.

There was no important development in war debt payments during 1937. Both Great Britain and France expressed interest in a new settlement in hope of reducing their obligations. The danger of neglecting payments was revealed in February when participation in a French loan in the U.S. was prevented by the Johnson Act of 1934 prohibiting the financing of government issues of any country whose debt payments were in default. Only Finland maintained her 1937 payments, Hungary making a partial payment (\$9,828 of \$88,651) in December in hope of securing a refunding. The status of the accounts with the thirteen nations whose debts are funded is shown by the following table as of Jan. 1, 1938:

Country	Amount Originally Owed	Amount as Funded	Total Default, Dec. 15, 1937
Belgium . . . . .	\$ 370,087,200.43	\$ 417,780,000	\$ 61,300,084
Czechoslovakia . . . . .	91,870,671.03	115,000,000	16,315,400
Estonia . . . . .	13,999,145.60	13,830,000	4,160,287
Finland . . . . .	8,281,920.17	9,000,000	
France . . . . .	3,404,818,945.01	4,025,000,000	455,000,163
Great Britain . . . . .	4,277,000,000.00	4,600,000,000	994,486,367
Hungary . . . . .	1,685,835.61	1,939,000	467,673
Italy . . . . .	1,648,034,050.90	2,042,000,000	84,119,757
Latvia . . . . .	5,132,287.14	5,775,000	1,607,298
Lithuania . . . . .	4,981,628.03	6,030,000	1,358,227
Poland . . . . .	159,666,972.39	178,500,000	51,766,147
Rumania . . . . .	37,922,675.42	44,500,000	7,438,750
Yugoslavia . . . . .	51,758,480.55	62,850,000	1,913,515

**Warfare.** For nearly a century the trend of the technical conditions of warfare has given a growing advantage to the defence, and has tended to discount a superiority of numbers on the part of the attacker. This advantage of the defence was created by the introduction of the breech-loading rifle, which enabled the firer to remain under cover while those who sought to attack him had to expose themselves in advancing. It became still more marked when the magazine rifle increased the rate of fire, and was intensified with the advent of the machine-gun. The defensive thereby became supreme, buttressed by trenches and barbed-wire entanglements. The effect has been to make decisive results in war far more difficult to attain, save against forces which lack modern equipment, and to reduce the chances of successful invasion.

Unless a decisive advantage is gained in a short time, deadlock is likely to develop earlier than ever, and to be established more firmly—unless the endurance of the defender be undermined by internal disturbance or shortage of supplies.

In so far as these conditions become recognized, they should tend to be a check on war. At present they have only been recognized far enough to make would-be aggressors more conscious of the importance of hastening their stroke and seeking an initial surprise. The creed and organization of the totalitarian state facilitates this purpose, if they also carry with them a tendency to mass effects which runs counter to the increasingly qualitative trend of warfare.

To its devotees, the totalitarian principle demands that in war a nation should place everything at its service; and, in peace, at the service of the next war. This picture of the way that a totalitarian war will be waged has been shown in many recent writings,

among which Ludendorff's *The Nation at War* is perhaps the best known abroad. Action should open without a declaration of war—in case the people of the nation which declares war should feel any guilty sense of being the aggressors. Within a few hours of the decision to make war the air, land, and sea striking forces must reach their full war readiness. The rest of the air and naval forces will complete their mobilization by the second day; and the rest of the land forces, a few days later. Hostilities will have already begun with the despatch of the mechanized divisions near the frontier to force an entry into the enemy country. On the seas the surface and submarine attack on the enemy's commerce will coincide with this opening stroke. The main land advance may begin a little later, because of the masses that will have to be brought up, and these will have to come by rail, since motors will be inadequate to carry the numbers. But by the end of the second week of war operations will be in full progress everywhere. Battle will follow till the enemy is finally crushed, or till reserves of men and material run out. The air force must first be used to help in beating the opposing army; only then will the army be able to act with its air force against the enemy country in rear. For this school, the land battle is still a process in which the infantry is helped forward by artillery, machine-guns, mortar and tank support, until it overwhelms the enemy in a man-to-man fight. Furthermore, "attack is always the deciding factor in battles." All movements should lead to battle; mechanization simply quickens its delivery.

This emphasis on battle is not due to any moral objection to striking direct against the enemy people—to quote Ludendorff again, "the demands of totalitarian warfare . . . will ever ignore the cheap theoretical desire to abolish unrestricted U-boat warfare." And aircraft will now combine with submarines in sinking every vessel which tries to reach the enemy's ports, even vessels sailing under neutral flags. Likewise on land a time will come "when bombing squadrons must inexorably and without pity be sent against the people in the enemy country."

But on military grounds, which are the ruling considerations, that time should normally be delayed until the battles have been won. Ludendorff declares that technical means are becoming ever more important, yet clings to the old belief that strength lies in numbers—"it is a fact that victory 'goes to the big battalions.'" Hence "the totalitarian war demands the incorporation in the army of every man fit to bear arms." It is clear that the faith of the totalitarian militarists is built on traditional military theory.

It is worth while to approach the problem of future warfare along this path, because it is a guide to the outlook which still prevails in the war ministries of Europe. The general trend of the rearmament race now in progress fosters it by piling up numbers, and by feeding the military chiefs with more means than their minds can assimilate.

Mechanization has given the general staffs a new ground for belief in mobile warfare—the picture to which armies always revert in peacetime. Despite the resistance which they everywhere offered to the idea of mechanization, now that they have embraced it, they build expectations on it which dumbfound a sober, and more long-standing, advocate of this development. In many countries they have burst out into prophecy that trench-warfare is a thing of the past, and that the wars of the future will be fought and finished with a quickness hitherto unknown.

There is little doubt that the new mechanized divisions will be used in the first hours of war with the aim of penetrating the enemy's frontier and opening the way for the subsequent general advance. All the general staffs are trending towards this new picture. They no longer think of waiting, as in 1914, until the main strength of the armies has been assembled. But there is reason to doubt whether this mechanized spearhead will produce the

decisive advantage which is sought. For obstruction is the natural antidote to the power of delivering mobile strokes which mechanization has revived. By utilizing rivers, canals, and railways as barriers, by demolishing bridges and blocking defiles, the defender may go far to nullify the new menace. Moreover, mechanization itself enables the means of obstruction to be moved more swiftly to any threatened spot. Despite the apparent advantage that mechanization has brought to the offensive, its reinforcement of the defensive is likely to prove greater still.

The prospects of this initial stroke by the mechanized forces are bright compared with those that await the main masses of the European armies. There is little ground for expecting that these will make more impression on the defence than in the last war. The main weapon that then stopped them was the machine-gun; there is now a far higher proportion of machine-guns, light and heavy, in all armies. The weapon on which the attackers mainly relied to overcome the defending machine-gun in the last war was artillery; at the outset of another, no army could expect to have the same amount of artillery as in 1918. Even if this could eventually be increased to the former scale, it is a weapon that, when used in mass, tends to block the path of the infantry it is trying to help. By ploughing up the ground, it acts as an automatic military brake. Armour, in the form of the tank, proved a better means in the last war of helping the attack forward; but armour used in direct assault against organized defence would now seem to have lost much of its value through the great and widespread development of armour-piercing weapons—there are now highly efficient anti-tank machine-guns, and even rifles, as well as guns. There are greater possibilities in the skillful use of obscurity as a cloak to the attack. Fog, natural or artificial, and darkness are the best antidotes to the defensive machine-gun. But the level of training required for effective operations in obscurity is difficult to attain during peacetime in mass armies raised by conscription. Moreover, the defence may find adequate means of turning darkness into daylight, and of dispersing fog or smoke.

A greater question that affects these mass armies is whether they will ever reach the battlefield. Their approach must be made by roads and railways; they will crowd these arteries which now, for several hundred miles back, lie under the menace of air attack. Their immense demands in food and ammunition supply requires a continuous circulation along these arteries; thus the strain is maintained all the way back even when the armies themselves have passed on. To gauge what might happen, it is worth studying the process of mobilization and assembly in 1914. Despite all the care devoted to its machinery, there were hitches which caused serious trouble, and threatened worse. Yet in 1914 there was no interference from the enemy such as is certain today through the intervention of air power. The complexity and delicacy of the process of mobilizing and moving forward an army is such that a mere touch may well suffice to cause its collapse. The larger the army the more susceptible it will be to dislocation—because the greater will be the congestion of all the traffic arteries.

If the opponent should employ mustard gas, the paralysis of war is still more probable. For in the fighting zone mustard gas is most effective as a defensive blocking agent. It forms the most impassable, if invisible, barrier to advance, especially advance by armies composed of infantry; while in the rear zone it is essentially a dislocating agent. But mustard gas is not necessary to produce this stagnation. Machine-guns and demolitions should suffice to stop an advancing army; air bombs acting on inherent congestion behind should suffice to prevent it remaining where it has stopped. Blocked in front, the mass army is likely to break down in rear. If the maintenance of such armies is straining the resources of the nations in peace, in war the attempt

to use them threatens national bankruptcy.

The attempt to seek victory in battle at sea has hardly more promise. There is no need to assume that the battle fleets will be bombed to destruction. The battle fleets of the last war were deterred from meeting each other by the menace of the submarine and the mine; such a paralysing effect would seem more likely than ever now that to these weapons is added the new threat of shore-based aircraft, and torpedo-carrying speedboats. It is worth notice that almost all the naval battles of history have been fought within present-day air range from a coastline. By contrast, these new agents—which can all be classified as “light craft”—promise to increase their potentialities of direct attack on sea communications, avoiding battle. Such guerrilla war at sea bulks large on the horizon of future war. It affects, not only the possibility of transporting large land forces overseas, but that of maintaining the supply of the armies which are there.

In the air, similar conditions prevail. It is difficult to bring the opposing air forces to battle, because the three-dimensional spaces are so vast and speeds so high. It is simpler, far simpler than it has ever been on land, to strike direct at the sources of the enemy's power without first defeating his forces. The complex web of a modern nation's commerce and industry, its administration and supply, offers a target as sensitive as it is large. Externally, the flow of its supplies may be more easily reduced to stagnation now that its trade-routes, and their approaches to port, are threatened by shore-based aircraft and other new agents of interference. One deduction we may draw is that the larger the armies that a country should attempt to send overseas, the more difficulty it will have, not only in maintaining them, but in maintaining itself. A corollary is that the first attention should be given to the reduction of national vulnerability, rather than to the creation of armies. Every means of diminishing and dispersing targets, and also of decreasing their sensitiveness, should be studied and sought. And the mental preparedness of the people is as important as the provision of material defences.

The positive forms of defence involve questions to which the answer is less sure. The power of evasion possessed by aircraft, and increased by their increasing speed, has been a justification for the view that in the air, as contrasted with the land, the attack was superior to the defence where it was aimed directly at ground targets. This view was defined in Mr. Baldwin's famous phrase—“The truth is that a bomber will always get through.” The result has been that the nations, whether their intentions were aggressive or purely self-protective, have tended to place their main reliance in large bombing forces. A country attacked would thus be ready to respond with an immediate counter-offensive, directed, not against the enemy's air forces, but against targets in his territory.

But recent experiences in Spain and China, while confirming the aircraft's power of evasion, has suggested that its destructive effect has been overestimated, at least where there is sufficient opposition to prevent an undisturbed approach and aim. While anti-aircraft artillery may not have scored a very much higher proportion of hits than in the last war, it has shown its value in preventing the bombers achieving the hits they intended. Aircraft used defensively for interception have had varying success, but sufficient on the whole to emphasize the question how far the value of bombing attacks balances their risks wherever the defence is proportionately strong. It would seem clear that, although defence is not yet master of attack in the air, the deterrent influence of its presence is far more powerful than its actual effect, while the effect attained by the attack decreases disproportionately with the multiplication of defensive means. (See also *CHEMICAL WARFARE; MUNITIONS OF WAR; PACIFISM; WORLD ARMAMENTS.*)

(B. H. L. H.)

**Warsaw**, province and capital city of Poland. The city, 315 miles E. of Berlin, on the W. bank of the Vistula, connected by four bridges (two railway) with Praga, its eastern suburb, is mainly modern and spacious.

**Area:** 47 sq.mi.; population (1931): 1,178,914 (833,500 Polish-speaking)—1937 estimate: 1,225,451.

It is the seat of a Roman Catholic archbishop and the metropolitan of the autocephalous church, a centre of thriving manufactures, of commerce (exporting corn and flax), and of education; the Don university had (1935-36) 9,050 students, the free university and academies, 4,494. There are two main railway stations (and two in Praga), an airport and broadcasting stations. The removal (June), by administrative order, of Pilsudski's coffin from St. Leonard's crypt to another vault in the cathedral caused controversy, afterwards reconciled. (H. Fw.)

**Washington**, a State in the extreme North-west United States, popularly known as "The Evergreen State." Area, 66,836 sq.mi.; population (U.S. census 1930) 1,563,396; estimate (July 1, 1937) 1,658,000. Capital, Olympia, 11,733; three largest cities: Seattle, 365,583; Spokane, 115,514; and Tacoma, 106,817. In 1930, the urban population was 884,539 or 56.6%. Native born whites dominate population percentages with 81.7%; of the 244,256 foreign born whites, Canada, Sweden, Norway, Germany, and England furnished over one-half. Negroes numbered 6,840; Japanese, 17,837; Chinese, 2,195; Filipinos, 3,480; Indians (Jan. 1, 1937), 13,098.

**History.**—The legislature met in its 25th session from Jan. 11 to March 11, 1937. The social security system was placed under a department, administered under the merit system, and was made conformable to Federal law. A maximum of 60 hours per week was prescribed for domestic labour, significant in view of the decision by the U.S. Supreme Court sustaining the Washington minimum wage law. A State teachers' retirement system was substituted for the old arrangement of local funds. Looking toward notable expositions and the semi-centennial for statehood (1939), a progress commission was voted \$250,000.

Public works under construction are the Grand Coulee dam (see DAMS) and the Roza irrigation project in central Washington which will reclaim 72,000 acres. Though comparatively quiet, the labour front reflected current trends. The C.I.O.-American Federation of Labor rivalry appeared in the strike on the *Seattle Star*; while Spokane saw the emergence of the closed shop issue in a laundry strike which failed after it had tied up the industry for two months and also witnessed a sit-down demonstration of W.P.A. workers.

The chief State officers are: Clarence D. Martin, governor; Victor A. Meyers, lieutenant-governor; Ernest N. Hutchinson, secretary of State; Cliff Yelle, State auditor; Phil H. Gallagher, State treasurer; G. W. Hamilton, attorney general; A. C. Martin, commissioner of public lands; William A. Sullivan, insurance commissioner; Stanley F. Atwood, superintendent of public instruction; Edward J. Reilly, speaker of the assembly; and William J. Steinert, chief justice.

Other members of the State Supreme Court are: John F. Main, John S. Robinson, George B. Simpson (appointed by governor to succeed Warren Tolman, resigned), O. R. Holcomb, Walter B. Beals, William J. Millard, Bruce Blake, James M. Geraghty.

**Education.**—The system of higher education includes a university, a State college, and three colleges of education. During the school year 1935-36, average daily attendance in elementary and secondary schools was 275,929, and the number of teachers employed therein, 11,401. Total expense for this instruction was \$27,026,735.23 and the cost per pupil in daily attendance \$84.56. Teachers' salaries averaged \$1,377.49. Training schools for boys

CLARENCE D. MARTIN, governor of Washington, acted as engineer on the first train over the new Grand Coulee Dam railroad

and girls are at Chehalis and Centralia respectively; schools for the blind and deaf, at Vancouver; one custodial school, at Medical Lake; and a new one in Western Washington. Recent legislation provides special State subsidies for training under-privileged children.

**Charities and Corrections.**—The State maintains four hospitals at Steilacoom, Sedro-Wooley, Medical Lake, and Soap Lake (the latter for the treatment of Buerger's disease); a Veterans' home at Retzil; a Soldiers' home at Orting; and a penitentiary at Walla Walla; and a reformatory at Monroe.

**Banking and Finance.**—Gross revenues for the biennium ending Sept. 30, 1936 were \$132,283,484.40 and the cash balance of the previous biennium \$11,939,443.90. The gas tax contributed \$28,344,111.91 and the sales tax (from April 1, 1935-March 31, 1936) \$14,964,825.31.

Total disbursements amounted to \$126,311,489.12; the cash balance was, therefore, \$17,911,439.18. The bonded debt is \$14,588,000. One hundred and eighty-five banks showed a total capital of \$29,594,000; capital surpluses and undivided profits of \$47,219,000; deposits of \$469,220,000; and resources totalling \$521,237,000 on June 30, 1936.

**Agriculture and Manufacturing.**—Agriculture, the leading industry, showed uniform gains in 1937.

Leading crops	Value 1936	Av. Prod. 1928-32	Prod. 1936 bu.	Prod. 1937 bu.
Wheat . . . . .	\$30,264,000	42,798,000 bu.	46,193,000	48,703,000
Apples . . . . .	22,291,000	33,768,000 bu.	28,000,000	30,340,000
Hay (wild & tame) .	18,286,000	1,592,000 tons	1,801,000	1,804,000
Potatoes . . . . .	8,811,000	8,047,000 bu.	8,010,000	9,400,000
Oats . . . . .	4,003,000	7,513,000 bu.	8,517,000	8,060,000
Pears . . . . .	3,510,000	3,921,000 bu.	5,400,000	5,594,000

Timber, ranking second as wealth producer, furnishes material for Washington's leading manufactured products; saw lumber, shingles, veneer and plywoods. Salmon and halibut still dominate another industry, fishing, in which Washington outranks other States. Rising in importance are large oysters, successfully transplanted from Japan, and pilchard, small fish akin to salmon, which are reduced to oil and a protein meal for chick-feed. Though ranking low in total value of minerals produced, Washington lists such scarce items as magnesite, tungsten, molybdenum, and chromium. During 1935, 2,865 manufacturing concerns produced goods valued at \$478,385,098. To develop these resources, the State possesses 19% of the nation's hydro-electric power.

(H. J. DE.)

**Washington**, District of Columbia, U.S., according to the Bureau of the Census, had a population of 627,000 on July 1, 1937, an increase of nearly 30% since 1930. This has been due in part, no doubt, to the expansion of Federal activities; but also, quite certainly, to the public and private im-

provements in the nation's capital and the amenities for pleasant and comfortable living thereby created.

**Planning.**—With the creation of the National Capital Park and Planning Commission in 1926 and the inauguration of a comprehensive public building program, a very real transformation in the Federal city has taken place. A notable contribution to supplement the regional plan was the publication in 1937 of the Report on the Baltimore-Washington-Annapolis Region. These three cities, once separated by thirty or forty miles of forests and rural clearings, are now part of an expanding urban and suburban region. The plans, when realized, will give adequate parkway and highway approaches to the nation's capital.

**Projects Under the Plan.**—The regional plan for Washington is slowly being realized. The much-travelled Mount Vernon Memorial highway to the home of George Washington will shortly be extended from the Arlington Memorial bridge to the Key bridge. This and the Leiter property, acquired by gift, comprising 167 acres and a mile and a half of shore front, are parts of the George Washington Memorial parkway which will include both sides of the Potomac river from Mount Vernon to Great Falls. Within the District of Columbia, it is now possible to drive through a parkway along the Potomac river and Rock Creek park from Haines Point to the District line, a distance of more than ten miles. The recently completed Piney Branch parkway adds to the park drives and the extension of the Rock Creek parkway into Maryland serves both the District and Maryland. With emergency funds, many of the parks of Washington have been rehabilitated and replanted. Meridian park on Sixteenth street has finally been completed. With Civilian Conservation Corps labour Fort Du Pont park, located on the partly completed Fort drive-way which will one day traverse the hills surrounding the city to connect the old Civil War forts, has made accessible a large area of picturesque native scenery. The Civilian Conservation Corps labour has made possible the planting and restoration to its natural state of Roosevelt island, lying in the Potomac river between the Arlington and Key bridges, as a fitting memorial to Theodore Roosevelt.

**Public Buildings.**—The Apex building, to be occupied by the Federal Trade Commission, designed by Bennett, Parsons and Frost, the Archives building and the National Gallery of Art, designed by John Russell Pope, will complete the Capitol end of the famous triangle of public buildings. The harmonious effect of planning the entire triangle as a unit is already apparent in the handsome buildings which line Pennsylvania avenue, Fifteenth street and Constitution avenue. In 1937, the new Department of Interior Building, designed by Waddy B. Wood, was completed and occupied. It lies across the parkway south of the old Interior building, and faces Constitution avenue, where the new Federal Reserve building, designed by Paul Cret, lines up with the National Academy of Sciences, designed by the late Bertram Goodhue, the Public Health building, designed by J. H. de Sibour, and several smaller structures to create an impressive avenue of buildings. In the Capitol group, the new Supreme Court, a new House office building and an extension to the Senate office building are occupied. The Library of Congress Annex, designed by Pierson & Wilson, is nearing completion. In the District Civic Center, the Police Court building, designed by Nathan C. Wyeth, has been erected.

**Art.**—The gift of the art treasures collected by Andrew Mellon, to be housed in a gallery, also donated by Mr. Mellon, places in Federal ownership a valuable art collection. A number of large murals by Barry Faulkner, Eugene Savage, Rockwell Kent, and others, are being placed in the new public buildings. An equestrian statue of General Artemas Ward, designed by Leonard Crunelle, the gift of Harvard university, is being placed in the

circle at Massachusetts and Nebraska avenues.

**Housing.**—The Public Works Administration built Langston Terrace, a project for coloured people, overlooking Anacostia parkway, near Benning road. Four large-scale housing projects, erected under the Federal Housing Administration's plan to aid private enterprise, are located in the Washington region, Colonial Village and Buckingham in nearby Virginia, Falkland, just north of the District line in Maryland, and Brentwood in the north-east section of the District. One of the four Greenbelt towns is located six miles from Washington, and is now being operated by the Farm Security Administration. The Alley Dwelling Authority is proceeding with its task of ridding the national capital of its two hundred inhabited alleys.

Two rehousing projects have been completed and two more are under construction. (H. Js.)

**Water Power.** The year 1937 witnessed the advent of no important new power sources nor of new means for power conversion. The fuels—coal, oil, and natural gas—together with falling water, continue to furnish the great bulk of power for all purposes. The means of utilizing the power of rivers are unaltered and the development of hydraulic turbines has continued along conventional lines.

Estimates of the amount of developed water power in the world indicate that the total was about 62,000,000 horsepower of installed water wheels as of 1936, which appears to have been increased to 63,000,000 or more by the close of 1937. The latest estimates of the total potential water power of the world, based on ordinary minimum flow and 100% efficiency, indicate a total of about 670,000,000 horsepower. However, in comparing these figures with those for developed power, it should be recognized that the estimates of developed capacity are based on installations of water wheels, which average two or three times the potential low-flow power at the sites of utilization.

Although there were many important water-power plants under construction, there were relatively few plants completed and put in operation in 1937.

Those reported as completed or under construction and their capacities in horsepower are:

**Austria.**—Construction was resumed at Persenbeug on the Danube river, 134,000.

**Canada.**—Of the plants completed, 167,000, the Outardes river in Quebec and the Montreal river in Ontario afforded 80,000. There were plants under construction or extensions of old plants, 50,000.

**Ceylon.**—The Ceylon Government authorized the construction of the Aberdeen Saxapana hydroelectric plant, 33,500.

**France.**—The Chambon dam was completed, increasing the annual water-power output at plants on the river below by 110,000,000 kilowatt-hours.

**Germany.**—Construction of a dam and power plant on the Elbe river at Hohenwarte was in progress.

**Great Britain.**—The Galloway Power scheme was completed with total capacity of 150,000 horsepower at five plants. Installations at the head of Loch Linnhe, Inverness, Scotland, are being increased by 50,000.

**Iceland.**—A power plant at Ljosafoss falls on the Sag river, 12,500, was put in operation.

**India.**—A plant was completed at the Mettur dam on the Cauvery river, 48,000. Construction was started on a plant on the Shimsha river, 27,000.

**Irish Free State.**—A power plant on the Liffey river at Pollaphuca, County Wicklow, was under construction.

**Japan.**—A power plant was under construction on the Shinano river in Niigata Prefecture, 300,000.

**New Zealand.**—Two units, 42,000, were added to the Arapuni plant making the total capacity 126,000.

**Poland.**—Three power plants were under construction: Duna-jec river, 13,400; Sola river, 26,400; and San river, 40,000.

**Sweden.**—A power plant was completed on the Indalsälven river at Krångede, 241,000.

A power plant on the Skellefte-Alf river was enlarged by 13,400 horsepower.

**Switzerland.**—Three plants were under construction, Bargis, 35,000; Trinsermähle, 40,000; and Isla Pin, 15,000.

**Union of Soviet Socialist Republics.**—A program of construction of 20 plants was announced in 1935, scheduled for completion: in 1936, seven plants, 233,000; in 1937, four plants, 336,000; in 1938, five plants, 381,000; in 1939, three plants, 493,000; and in 1940, one plant on the Kama river near Perm, 423,000.

No progress report is available with relation to this schedule. The plant near Perm and two plants on the upper Volga—at Rybinsk and at Uglich—total for the three plants 1,270,000 horsepower, were under construction. The Dnieper plant after five years of service is to be enlarged next year to 750,000 horsepower by the addition of 170,000 horsepower. A power plant is being installed at Stalinogorsk, 134,000.

**United States.**—The increase, 365,000, in completed water-power plants was divided between new plants, 243,000, and additional units, 122,000. The larger of the new plants are, Bonneville, 120,000, on the Columbia river in Washington; Sutherland, 33,500, on the North and South Forks of the Platte river in Nebraska; Buchanan and Inks dams, 45,000, on the Colorado river in Texas; and the Upper Salmon development, 26,000, on the Snake river in Idaho. A new unit, 115,000, was added at Boulder dam, on the Colorado river, increasing the capacity there to 515,000. Construction was in progress at Fowler Bend dam, initial 80,000, ultimate 160,000, on Hiwassee river; at three plants on the Tennessee river: Guntersville, initial 102,000, ultimate 136,000; Chickamauga, initial 108,000, ultimate 144,000; and Pickwick Landing, initial 96,000, ultimate 288,000; at two dams on the Columbia river: Bonneville in Oregon, initial 120,000, ultimate 600,000; and Grand Coulee in Washington, ultimate 2,700,000; at Fort Peck on the Missouri river, initial 94,000, ultimate 141,000; on the Flathead river in Montana, initial, 77,000, ultimate 154,000; at Boulder dam on the Colorado river in Arizona and Nevada, present installation 515,000, ultimate 1,835,000; at Parker dam on the Colorado river, ultimate 100,000; at Shasta dam on the Sacramento river in California, initial 375,000; ultimate 470,000; at Marshall Ford dam on the Colorado river of Texas, initial 45,600, ultimate 68,300; at Elephant Butte dam on the Rio Grande, ultimate 26,000; at the Tri-county development on the Platte river in Nebraska, ultimate 70,000. The total ultimate capacities of these plants is about 6,900,000 horsepower, compared with 17,120,000 horsepower, the total developed water power in the United States as of Jan. 1, 1937.

**Uruguay.**—Contract has been let for a large plant on the Rio Negro, scheduled for completion in 1942. (N. C. G.)

**Waziristan.** Turbulence continued during 1937 in this difficult tract on the N.W. frontier of India; and a large force of British and Indian troops, including 5,000 irregulars, was kept busy coping with the guerrilla tactics of the tribes. The establishment of a powerful cantonment at Razmak was followed by an extension of the protected tribal areas beyond the Tochi valley, and 100 additional miles of road are being constructed. The position was quieter towards the end of the year, as a faqir of Ipi, who had been active in the attacks on the Indian forces, had been driven out of the Shaktu valley.

## Wealth and Income, Distribution of.

Distribution of wealth continued to be a major problem in the United States during 1937. The Federal Government had for years made distribution a major goal in hope of increasing purchasing power. Not only was the high rate of taxation on top income brackets maintained in 1937 (a surtax of 72-75% being levied on incomes in excess of \$1,000,000 in addition to the normal 4%), but strong efforts were made through excess profits taxes to force a distribution of corporate income. Farm legislation was urged to balance agricultural with industrial incomes, while President Roosevelt's determination to lower prices without wage reduction was intended to increase purchasing power. Elimination of poor housing and scanty clothing resulting from insufficient income was a major purpose of the administration.

Statistics published by the Brookings Institution in 1934 regarding the income of 27,474,000 United States families in 1929 reveal that 21.47% received under \$1,000 and earned but 3.76% of the \$77,116,000,000 total. Nearly three-fifths of the total families (59.53%) earned under \$2,000 and received less than a quarter of the income (23.64%). Over three-fourths of the families (78.42%) earned under \$3,000 and received only two-fifths of the income. On the other hand, but 24,000 of the families (.088%) earned \$8,753,000,000 or 11.35% of the income. Denials that high incomes decrease purchasing power are without foundation. Stuart Chase shows in *The Economy of Abundance* that while men earning over \$1,000,000 spend but 7.7% of their income and those receiving over \$50,000 but under \$1,000,000 spend but 48.1%, those earning from \$2,000 to \$5,000 spend 86.7% and those under \$2,000 as much as 94.1%. While income tax statistics do not present a complete picture of actual income and do not include the small incomes, the following figures for net income in 1933 show the number of individuals in each class:

Class	Number
Over \$1,000,000 . . . . .	50
\$500,000 to \$1,000,000 . . . . .	81
\$300,000 to \$500,000 . . . . .	141
\$150,000 to \$300,000 . . . . .	695
\$100,000 to \$150,000 . . . . .	1,084
\$50,000 to \$100,000 . . . . .	6,021
\$25,000 to \$50,000 . . . . .	18,423
\$10,000 to \$25,000 . . . . .	75,043
\$5,000 to \$10,000 . . . . .	229,754
\$3,000 to \$5,000 . . . . .	599,075
\$2,000 to \$3,000 . . . . .	914,198
\$1,000 to \$2,000 . . . . .	1,480,717

The latest figures regarding income distribution according to type of income are for 1937 when compensation for employees totalled \$44,983,000,000; dividends and interest, \$9,293,000,000; and entrepreneurial withdrawals, rent and royalties, \$13,187,000,000. Of employee payments \$15,825,000,000 was from manufacturing, mining and construction; \$4,845,000,000, from transportation and public utilities; \$7,958,000,000, from trade and finance; \$14,494,000,000 from Government service; and \$1,800,000,000 from work relief. Total income for 1937 (\$67,463,000,000) was at an index of 86.2 (1929=100) as compared with 79.8 for 1936. (X.)

**Great Britain.**—The statement is often made that the rich are getting richer and the poor poorer, and great emphasis is laid upon the immense contrast between wealth and poverty. Writing in 1920, for Great Britain, Sir Josiah Stamp found that there had in fact been little change in the "slope of distribution" for 100 years (see *Encyclopædia Britannica*, vol. 23, pp. 452-53).

But as regards capital wealth, a recent work (1937) on the change in distribution of capital in Great Britain by Daniels and Campion establishes certain conclusions very clearly. More than

half of the total capital in 1924-30 and 1911-13 was owned by persons with more than £5,000 each. The two lowest capital groups include the majority of the population, the capital included being one-sixth of the total in 1924-30. If estates paying fixed duties are separated from others in the group £100-£1,000 and one-sixth of the value of the remaining estates is added, the amount of capital owned by persons having between £100 and £500 is estimated at £790-£890 millions.

Perhaps a percentage table will bring out the nature of the change more definitely:

Total	1924-30 Percentage of total wealth	1911-13 Percentage of total wealth	Total	1924-30 Cumulative percentage of numbers	1911-13 Cumulative percentage of numbers
£100 or less . . .	3.6-6.1	6.0-11.1	More than £100	21.3-23.7	11.6-13.4
£100-£1,000 . . .	10.4-11.1	10.0-10.4	£1,000 . . .	5.8- 6.4	2.9- 3.3
£1,000-£5,000 . . .	17.0-17.7	15.7-16.0	£5,000 . . .	1.6- 1.8	0.8- 0.9
£5,000-£10,000 . . .	10.0-10.3	9.7-10.0	£10,000 . . .	0.8- 0.9	0.4
£10,000-£25,000 . . .	14.4-14.8	14.0-14.6	£25,000 . . .	0.2- 0.3	0.1
£25,000-£100,000 . . .	18.6-19.1	18.7-19.5	£100,000 . . .	0.04-0.05	0.03
Over £100,000 . . .	23.2-23.8	21.6-22.9			

Such reduction as there has been in the inequality of the distribution of capital since before the World War is due in part to the change in the age distribution of the adult population during the period. The number of persons has increased more in the higher than in the lower age groups, and the inequality of distribution of capital is also somewhat less in the higher than in the lower age groups. Comparison, age group by age group, between 1924-30 and 1911-13, gives further indication that the distribution of capital is less unequal than it was before the War.

More than half the capital of the country is owned by persons over 55, and about three-quarters by persons over 45. After 55 the inequality of distribution does not alter much. Beyond this age, the richer may get richer, but the proportion of those with £100 or less remains at about two-thirds of the total number of such adult persons. The changes in the distribution of income in Great Britain are not similarly available for recent years. But Mr. Colin Clark has made the following computation for 1929:

	Numbers (ooo's)	Income (£s million)
Over £10,000 . . . . .	10	228
£2,000-£10,000 . . . . .	100	388
£1,000-£2,000 . . . . .	195	235
£500-£1,000 . . . . .	481	309
£250-£500 . . . . .	1,249	402
£125-£250 . . . . .	5,827	1,009
Under £125 . . . . .	11,800	1,170
Total . . . . .	19,662	3,741

His comment is: "The inequalities of distribution are very considerable. Speaking of the years 1929 or 1935, we can say that one-tenth of the whole working population, with incomes over £250, took 42% of the whole total of personal incomes, or just under half, if we allow for the fact that the greater part of the non-personal incomes, in the form of undistributed company profits and such, accrued for the benefit of the rich. A small class, comprising 1½% of the population, with 'four-figure incomes' and upwards, took 23% of the whole total of personal incomes."

Recent computations of the German national income give the divisions into industrial classes or sources, but not income groups. In 1913 wages and salaries were 45.3% and from 1929 to 1936 the figure has varied from 55.8 to 58.1%. Trades and professions were 20.1% in 1913, and in 1929 became 15.5%, sinking steadily to 13% in 1935-36. Agriculture accounted in 1913 for 12.5%, and fell to 7.2%, rising to 9.9%. Pensions, which were 3.1% in 1913, became 12% in 1929, 20.6% in 1932, and went back to 12.2% in 1936 (*National Industrial Conference Board*, 1937).

The American figures show that in 1913-17 agriculture accounted for 17.2%, and this sank to 11.7%, in 1923-27, and 8% in 1930. Manufacturing went from 29.8 to 27.4 and 26.3%; service and trade, 33.6, 40.5 and 44.3% respectively; Government, from 5.2 to 7.2 and 9%. By functional sources the movement was: wages and salaries, 57.5, 65.5, and 63.1%; entrepreneurial 32, 26.3 and 24.7%; property move 10.1, 8.2 and 10.2%. The main difficulty in dividing the total national income into income groups is that the direct taxative individual total income returns do not extend below the higher income groups, enjoyed by a mere minority. It has been shown recently that these tend to move differentially on a change in price levels, and the highest groups rise proportionately more than the lower groups. Sir Josiah Stamp recorded that, as the price level rises (not in time, but in magnitude), the percentage which the 25,000th income is of the 10,000th income steadily falls; in other words, the very rich gain relatively in income with a high price level, or lose relatively with a low—their income is more sensitive to the effects of the change.

**Weather:** see METEOROLOGY.

**Welding:** see COLUMBIUM.

**Welfare Work.** While applied in England only to voluntary improvement of working conditions by industrialists, the term welfare work is more broadly used in the United States to indicate the relief of distress and evil conditions among the poorer classes of the population generally. Until 1933 such work was largely in private hands, but since that time public participation has greatly increased with the Federal Government assuming a large proportion of the expense.

As special aspects of welfare work are treated in separate articles, only a general picture of the activities are needed here. Private relief, treated in the articles on COMMUNITY CHESTS and DONATIONS AND BEQUESTS, began to show a slightly increased ability to assume its former load in 1937. Only the greatly increased burden of relief in recent years rendered private aid entirely inadequate, for community chest contributions which reached a low of 84% of their 1920 level in 1935 returned to 93%. As there were no funds for expanding existing agencies, however, extraordinary demands for aid must continue to be met by public funds.

United States public welfare work during 1937 covered both immediate and prospective relief. Aid to the unemployed by the financing of public works, pensions for the aged, and increased assistance to children, mothers, and the blind were balanced by the expansion of such schemes as unemployment insurance, the insurance of bank deposits and the erection of model villages (see CHILD WELFARE; RELIEF; SOCIAL SECURITY; SOCIAL SERVICE). State Legislation adapting local welfare systems to Federal requirements was general throughout the nation. The extent of Federal participation in welfare work can be seen in the fact that the Public Works Administration aided in the building of 70% of the schools, 62% of the hospitals and 64% of the waterworks constructed in its four year history (1933-37) having spent approximately \$1,099,000,000 for wages and \$1,900,000,000 for materials much of which went for wages, and that appropriations for the Works Progress Administration reached \$8,844,000,000 early in 1938. As the expenditures of State and local governments were also large, there was little indication that public welfare participation would soon be reduced.

**Great Britain.**—The field of agreements covering industrial amenities to workers was dominated during 1937 in Great Britain by the question of paid holidays. The setting up of a committee on this question by the minister of Labour early in the year and

an invitation to all industries to submit evidence have concentrated attention in the movement, which has been singularly uneven in its development since the end of the World War. The committee concluded its public sittings early in Dec. 1937 and is expected to publish its recommendations in the first quarter of 1938. The ministry of labour itself submitted a memorandum to the committee, tracing the development of the movement for annual holidays with pay in Great Britain. This showed that immediately after the War the practice of granting paid holidays spread considerably, and in Aug. 1920 there were close on 60 general and district collective agreements between employers and workpeople for paid holidays. The more important general agreements were those covering the railway service, tramway service, printing and book-binding, boot and shoe manufacture, the non-trading services of local authorities, heavy chemical manufacture, flour-milling, match manufacture, cement manufacture, paint, colour and varnish manufacture, cocoa, chocolate and jam manufacture, and gas works. Among the district agreements were those affecting omnibus workers in London, newspaper printing in London, and the employees of retail co-operative societies and of electricity supply undertakings in certain areas.

By Dec. 1922, the number of district agreements formulated brought the total up to 100. In the next two or three years no important new agreements were announced, and in March 1925 it was estimated that about 1,500,000 manual workers were granted paid holidays. Since 1925, the most important new paid holiday agreements have been those affecting the explosives industry (July 1925), Leicester lambswool spinning (1926), London tanning and currying (1927), asbestos manufacture (1928), good road transport (1935), municipal omnibus services (1935), Smithfield meat-market workers (1936), London flint glass bottle makers (1936), furniture removers (1936), and pottery workers (April 1937).

The increase in the number of these agreements since 1926 has been offset to some extent by the lapsing or termination of certain agreements, and the diminution in the number employed on railway service.

It is estimated that at the present time about 1,750,000 manual workers are paid during holidays. In addition, of course, there are approximately 5,000,000 workers in offices and the distributive trades and officials of industrial undertakings and government workers who are granted paid holidays.

Affecting a smaller number, but showing a more consistent development, is the welfare work inside factories. An official of the Industrial Welfare Society estimates that there are 1,200 firms in Britain now operating such amenities as a ten-minute mid-morning break, accompanying repetitive processes with gramophone records of light music, providing cheap and well-cooked meals in specially equipped canteens, restaurants, rooms for women workers, recreational facilities, and well-decorated private cinemas used occasionally for the development of amateur dramatic talent among the firms' staffs.

The tendency towards improved architectural design in factories, with increasing use of glass suntraps, has been noticeable on trading estates, especially to the west and north-west of London.

**Wellesley College** in Wellesley, Mass., founded in 1870, is a four-year liberal arts college enrolling approximately 1,500 women. It is pre-eminently for candidates for the B.A. degree, but also offers the degrees of Master of Arts and Master of Science, and a certificate in hygiene and physical education. This department received new impetus during 1937 when a fund was completed for building a

swimming pool.

In 1937 there were approximately 12,000 graduates, representing a wide variety of interests. The faculty numbered 180 men and women trained in nearly 100 universities and colleges. The self-perpetuating board of trustees consisted of 23 men and women. The college had trust funds amounting to \$10,191,157 and a plant valued at \$10,808,888.

Wellesley tradition includes an emphasis on scholarship, intelligent religious interest, constructive citizenship and aesthetic appreciation. Special events during 1937 emphasizing these traditions included: discussions on problems of religion sponsored by the Christian Association and Biblical History Department; presentation of Gluck's ballet, *Don Juan*, by the Theatre Workshop, Orchestis Dance Group, and Orchestra; presentation of Bach cantata by the choir with Princeton College Choir and Harvard Glee Club; Sesquicentennial Conference on the Federal Constitution and authorization by Sigma Xi honorary science society of a Wellesley chapter. (M. H. McA.)

**West Indies**, an archipelago between Florida and South America, including the Greater Antilles (Cuba, Hispaniola, Porto Rico, and Jamaica, with lesser, adjacent islands) and the Lesser Antilles; languages, Spanish, English, French, and Dutch. The area is approximately 99,000 sq.mi. Population (estimate, 1937) 12,020,578; predominantly white in Cuba and Porto Rico; elsewhere, over 90% negroid, except in Trinidad, where it is 40% East Indian. The West Indies includes three republics, two United States dependencies, and nine European colonial dependencies (six British, two French, one Dutch), with their several subdivisions. Trade is principally with the United States and, in the case of colonies, with their respective metropolises. Imports are largely flour and other foodstuffs, textiles, and miscellaneous manufactured articles. Exports comprise sugar and other products of tropical agriculture and, from Trinidad and Curaçao, petroleum products. Resources are almost entirely agricultural, except in the larger islands where some undeveloped mineral resources exist, and in Trinidad and Curaçao. Economic conditions in 1937 showed a general improvement. (See BAHAMAS; BARBADOS; CUBA; CURAÇAO; DOMINICAN REPUBLIC; GUADELOUPE; HAITI; JAMAICA; LEEWARD ISLANDS; MARTINIQUE; PORTO RICO; TRINIDAD AND TOBAGO; VIRGIN ISLANDS; WINDWARD ISLANDS.)

(L. W. BE.)

**West Virginia**, popularly known as the "Panhandle State," was formed from Virginia during the Civil War and admitted to the Union, June 20, 1863. It has an area of 24,170 sq.mi. Its population in 1930 was 1,729,205 of which 1,613,934 were whites (51,520 foreign-born). Its total urban population was 491,504. Its population July 1, 1937, was estimated at 1,865,000. Its capital is Charleston (population 60,408). Its other chief cities are Huntington (75,572) and Wheeling (61,659). It has 4,125mi. of steam railway, 381mi. of electric railway and a new and extensive system of improved highways (over 4,315mi.).

The chief state officers in 1937 were: governor, Homer A. Holt; secretary of state, William S. O'Brien; treasurer, R. E. Talbott; auditor, Edgar B. Sims; attorney-general, Clarence Meadows; commissioner of agriculture, J. B. McLaughlin; superintendent of schools, W. W. Trent.

**Education.**—Education is free in the public schools for all children between six and 20 years of age and is compulsory for all between seven and 16. The pupil enrolment in the state elementary schools for 1937 was 334,311. In the 400 state high schools it was 120,104. The number of teachers was 11,545

in the elementary schools and 4,505 in the high schools. The total State appropriation for elementary and secondary education in 1936-37 was \$13,545,502.

The State supports eight teachers-training colleges which have a total student enrolment of 3,272 and a total instructional membership of 236. It also supports the West Virginia university which in Dec.

1937 had an enrolment of 2,668, a total faculty membership of 232, and (for the year 1936-37) had a total income of \$2,292,501.

**Banking and Finance.**—On July 1, 1936, the total deposits of the 106 State banks and trust companies was \$130,527,814. The total deposits of the 79 national banks in the State was \$142,458,000.

The summarized finance statement of the State treasurer for the fiscal year 1936-37 is as follows:

Balance July 1, 1936	\$ 8,752,050.15
Receipts for 1936-37	130,953,227.51
Total	\$139,705,277.66
Disbursements, 1936-37	127,151,842.05
Balance, July 30, 1937	\$ 12,553,435.61

On July 1, 1937, the total State bonded debt was \$81,494,300; the total amount of outstanding State road bonds was \$75,927,000.

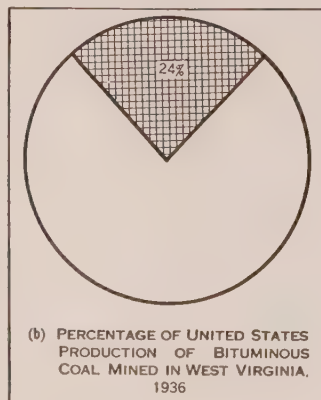

The total assessed value of all property in 1937 was \$1,784,632,554 (real estate, \$830,798,008; personal property, \$371,683,346; public utilities, \$582,151,200).

The Federal income tax collected in West Virginia for the fiscal year 1936-37 was \$9,236,843 (of which \$4,951,179 was from corporations and \$2,412,516 from individuals). The Federal tax on capital stock was \$640,555; on transfer of estates of decedents, \$901,055; on property transfers by gifts, \$331,536.

**Industries.**—In 1935 the oil production of West Virginia was 3,959,000bbls. (which decreased to 3,847,000bbls. in 1936) and the natural gas production was about 100,000,000,000 cu.ft. The coal production was 99,179,000 short tons of which nearly 31,000,000 was produced from the Kanawha geological series. It and the coking operations (1,758,795 tons) furnished employment for 109,779 persons. In 1936 coal production showed a marked increase—83,950,493 tons to Oct. 1, or about 117,000,000 tons. In 1935 the State had 1,042 industrial establishments, which em-

HOMER A. HOLT, governor of West Virginia

ployed 77,317 persons and paid \$80,105,045 in wages. These plants had a total production of about \$370,230,129—indicating a considerable decrease since 1929 but well above figures for 1931 and 1933.

**Agriculture.**—The acreage, production and value of the chief farm crops during 1936 were as follows:

	Acreage	Yield	Value
Corn . . . . .	503,000	11,569,000 bu.	\$12,147,000
Wheat . . . . .	150,000	2,025,000 bu.	2,167,000
Oats . . . . .	67,000	1,206,000 bu.	687,000
Buckwheat . . . . .	17,000	255,000 bu.	217,000
Hay . . . . .	690,000	516,000 tons	7,290,000
Apples . . . . .	..	2,304,000 bu.	2,557,000
Potatoes . . . . .	32,000	1,920,000 bu.	2,496,000

**Whaling:** see FISHERIES: *Whaling*; WILD LIFE CONSERVATION.

## Wharton, Mrs. Edith Newbold Jones

(1862-1937), American novelist noted chiefly as chronicler of early Fifth avenue, was born in New York city, Jan. 24. Although receiving no formal education, she began writing short stories and volumes on travel at an early age. It was not until her first novel, *The House of Mirth* (1905), however, that she became widely known. Her next great success, *Ethan Frome*, a tragedy of New England life (1911), was followed by relief work in Paris during the World War. Her literary work was resumed in 1920 with *The Age of Innocence*, most popular of her novels and winner of the Pulitzer prize for the year. Having established a reputation, she continued to produce successful stories including four volumes portraying life in New York city from 1840 to 1870. After 1906 most of her life was spent in France, where she died on Aug. 11, 1937 at her villa near Saint Brice. Further information regarding her career may be found in the *Encyclopædia Britannica*, vol. 23, p. 557.

**Wheat.** World production was 3,808,000,000bu. in 1937, as against 3,544,000,000bu. in 1936 and an average for the last five years of 3,674,000,000 bushels. During the last ten years world consumption has averaged about 3,770,000,000bu. annually. These figures throughout omit Russia and China, for which no reliable data are available. For the Northern Hemisphere the 1937 harvest is estimated at 3,378,000,000 bushels. European production is placed at 1,530,000,000bu.; that of the United States, 873,993,000bu., and Canada 183,000,000 bushels. The Southern Hemisphere's production totalled about 378,000,000 bushels. Of this 163,000,000bu. represented the Australian crop and 15,000,000bu. the harvest of the Union of South Africa. Frost damage near the end of the year reduced the Argentine harvest from 230,000,000 to an estimated 200,000,000 bushels.

**Exports.**—Estimated exports for 1937-38 are placed by the United States Department of Agriculture at 485,000,000bu. divided as follows: United States, 95,000,000bu.; Canada, 65,000,000bu.; Argentina, 95,000,000bu.; Australia, 100,000,000bu.; Danubian countries, 65,000,000bu.; others, 60,000,000 bushels. World wheat supplies increased from 1929 to and including 1933, but, until 1937, declined because of droughts in the United States and also in Europe. The 1937 crop is the first yield since 1933 with a trend toward a small surplus.

**Wheat Harvest Months.**—In considering world-wide wheat production it should be appreciated that practically every day in the year is a wheat harvest day somewhere in the world. Follow-

# WHEAT

ing are the wheat harvest months of the principal wheat-producing countries:

January—Australia, New Zealand and Chile.

February and March—East India, Upper Egypt.

April—Lower Egypt, India, Syria, Asia Minor, Persia, Cyprus and Mexico.

May—Algeria, Central Asia, China, Japan, Morocco; in the United States, Texas.

June—Southern France, Italy, Spain, Portugal, Turkey, Greece; in the United States, Alabama, Arkansas, California, the Carolinas, Georgia, Kansas, Kentucky, Louisiana, Mississippi, Missouri, Oklahoma, Tennessee, Virginia.

July—Germany, France, South of England, Czechoslovakia, Rumania, Bulgaria, Austria, Hungary, South Russia, Switzerland; in Canada, Ontario; in the United States, Colorado, Illinois, Indiana, Iowa, Michigan, Minnesota, Nebraska, New England, New York, Ohio, Oregon, Washington, Wisconsin.

August—England, Belgium, Holland, Denmark, Poland; in Canada, the Western Provinces and Quebec; in the United States, the Dakotas.

September and October—Scotland, Sweden, Norway, Northern Russia.

November—Argentina, Peru, South Africa.

December—Argentina, Burma.

**United States Harvest.**—The 1937 crop is the largest in the United States since 1931. The yield was estimated at 13.6bu. to the acre. In all, 64,460,000ac. were harvested, yielding 873,993,000 bushels. This compares with an acreage of 48,863,000ac. and a crop of 626,766,000bu. in 1936 when the yield was 12.8bu. to the acre. The 1937 crop consisted of winter wheat to the amount of 685,102,000bu. and 188,891,000bu. of durum and other spring wheats. The hard red spring wheat and durum wheat are about ample for domestic requirements. There is, however, a considerable excess of hard and soft winter wheat and of white wheats, from which exports may be drawn in larger volume than the 95,000,000bu. estimated for the exports from the United States in 1937-38. It is expected that the United States will have a carryover of about 200,000,000bu. July 1, 1938. The carryover July 1, 1937, was 91,200,000bu., and July 1, 1936, it was 142,256,000 bushels. The record quantity of old wheat held over in the United States was on July 1, 1933, when stocks on hand amounted to 378,000,000 bushels. The average carryover from 1930 to 1934, as of July 1, was 326,000,000 bushels. The parallel average for the five-year period of 1924-28 was about 115,000,000bu. of holdover wheat. The world carryover July 1, 1937, was estimated at 518,000,000 bushels. July 1, 1936, it was 727,000,000 bushels. July 1, 1935, it was 915,000,000bu., and the year before that (1934) it was 1,155,000,000 bushels. The largest wheat crop ever produced in the United States was in 1915, when, under the influence of World War prices, 1,025,801,000bu. were harvested.

Prices for wheat have generally advanced steadily since 1933, a movement that reflected the widespread rise in commodity prices and four successive harvests that were below average in the Northern Hemisphere and the short crop of 1935-36 in the Southern Hemisphere. Prices in 1937 rose sharply in June and July on news of serious damage to the Canadian crop and on reports of drought injury to spring wheat in the United States, and the threat of rust damage. This information proved exaggerated and prices declined. There was further decline in the autumn as commodity prices reflected the break in the security markets. In November and December news of shorter crops in the Danubian countries, serious frost damage to the Argentine crop, principally in the Province of Buenos Aires and the Territory of La Pampa, and a renewed activity by purchasers in importing countries caused a stiffening of prices. Russia, however, continued to be the largest factor of uncertainty in the price situation. The U.S.S.R. had a larger crop than in 1936. What portion of this may come into world markets is wholly problematical, as both production and distribution are controlled by the Soviet Government and political as well as economic forces dictate commodity movements. Today

Upper: 10,000 BUSHELs of Texas Panhandle wheat are dumped on the ground waiting storage space

Centre: KANSAS THRESHING MACHINE contributes to the largest U. S. wheat crop since 1931

Lower: RAILROAD CAR HOISTED IN AIR and tilted to unload its cargo of wheat at the Santa Fe elevator in Turner, Kansas

Russia has not the same need to maintain foreign balances by exporting wheat as she did several years previously, and no undue quantity of Russian wheat may come into world markets.

**World Production in 1937.**—*North America:* United States, 873,993,000bu.; Canada, 183,000,000; Mexico, 13,000,000.

*Europe:* Italy, 296,010,000; France, 246,000,000; Germany, 161,000,000; Spain, 135,000,000; Rumania, 136,000,000; Yugoslavia, 86,000,000; Hungary, 70,000,000; Poland, 68,000,000; Bulgaria, 57,000,000; Czechoslovakia, 51,000,000; England and Wales, 49,000,000; Greece, 34,000,000; Sweden, 27,000,000; Belgium, 15,000,000; Austria, 15,000,000; Portugal, 15,000,000; Netherlands, 13,000,000; Denmark, 12,000,000; Ireland, 8,000,000; Lithuania, 8,000,000; Latvia, 7,000,000; Switzerland, 6,000,000; Finland, 6,000,000; Scotland, 4,000,000; Norway, 3,000,000; Estonia, 3,000,000; Albania, 1,000,000; Malta, 326,000.

*Asia:* India, 366,000,000; Turkey, 141,000,000; Japan, 49,000,000; Syria and Lebanon, 17,000,000; Chosen, 11,000,000; Palestine, 3,000,000.

*Southern Hemisphere,* excluding South Africa: Argentina, 200,000,000; Australia, 163,000,000.

*Africa:* Egypt, 46,000,000; Algeria, 34,000,000; Morocco, 19,000,000; Tunisia, 19,000,000; Union of South Africa, 15,000,000.

The acreage seeded for harvest in 1937 in the United States was estimated by the Department of Agriculture at 81,000,000ac., the largest in the history of the country. The previous largest acreage was in 1919, and from that year to and including 1924 the seeded acreage declined from 77,000,000 to 56,000,000 acres. It rose to 71,000,000ac. in 1928 and during the 1924-32 period averaged 67,000,000 acres. The Department of Agriculture sees possibility of a still larger increase in the acreage seeded for harvest in 1938. Wheat prices have been relatively high as compared to rye and there is a probability that growers will reduce the 1938 rye acreage in favour of wheat. Further shifts from corn to wheat, the department points out, were indicated in parts of the hard red winter wheat areas because dry weather has made corn-growing unsatisfactory in recent years. Had not a very heavy abandonment of wheat acreage taken place in 1937 the crop probably would have exceeded 1,000,000,000bus. and possibly the peak record of 1915. (See also CEREALS.) (S. O. R.)

**White, Maude Valerie** (1855-1937), British composer of popular songs; born at Dieppe, June 23. Miss White studied at the Royal Academy of Music, London, and was elected to the Mendelssohn scholarship, which, however, ill-health caused her to give up. She did her best work with settings of words by Herrick and Shelley, such as "To Daffodils" and "To Electra" from Herrick, and "My Soul is an Enchanted Boat" from the "Prometheus Unbound" of Shelley. Her most popular song was "Until." In 1894 she published a translation of Axel Munthe's *Letters from a Mourning City* (Naples). She died in London, Nov. 2, 1937.

**White Russian S.S.R.** lies in the west of the Soviet Union, bordering on Poland and Latvia, and forming an important strategic outpost. The capital is Minsk, and the national flag is red, with the hammer and sickle on the left in gold, with a five-point star above and initials BCCP underneath. Of the leading cities, Minsk had (1936) 198,000 inhabitants, Vitebsk 143,800, and Gomel 139,500.

**Area and Population.**—Area: 127,000 sq.km., mainly plain, with hills in the north, and great marshes in the south, which are now gradually being drained. Population (1933), 5,439,000 (rural 4,549,000, urban 890,000), made up of 80.6% White Russians, 8.2% Jews, chiefly in the towns, 7.2% Russians, and the rest Ukrainians, and Poles.

**History.**—On February 19 the Twelfth Extraordinary White Russian Soviet Congress in Minsk adopted the new constitution of White Russia. According to paragraph 14 of the constitution, the republic includes 4 regions, 66 districts, and 4 towns with independent administrations. With the participation of 97.4% of the population in the elections to the Supreme Council of the U.S.S.R. on Dec. 12, 1937, White Russia takes second place among the Union Republics. The campaign carried on in the whole of the Soviet Union against alleged Trotsky wreckers and Fascist spies also claimed many victims in White Russia. Many of the heads of the republic (including 2 premiers), as well as high party officials, were denounced and imprisoned. Some of the accused, including President Chervyakov, committed suicide.

**Trade and Communications.**—*Agriculture:* Sown area (1936) 14,589 square miles. In 1937 there were 87.5% collectivized peasant households. Chief products: potatoes, flax, hemp. In pig culture, White Russia holds the first place in the U.S.S.R.

Natural resources include peat and valuable forest land (one-quarter of the territory of the republic). Commerce and Industries: Retail trade turnover (1936) 2.3 milliard roubles. Chief exports: Pork, bristles, timber, paper, matches, machine tools.

Nineteen hundred and thirty-six output of industry (prices 1926-27) 1,413 million roubles; 1936 output of electricity—388,000,000 kilowatt hours.

Industries: linen, footwear, bristles, food, timber, paper, matches, cement, glass, tailoring, metal.

**Transport.**—In 1936, 3,094km. of railways carried, 18,365,000 tons of freight. (S. YAK.)

**Wholesale Prices:** see PRICES, STATISTICS OF.

**Widor, Charles-Marie** (1845-1937), French organist and composer who until 1934 was a director of the American Conservatory of Music at Fontainebleau. Born in Lyon, Feb. 22, 1845, he studied in Brussels under Lemmens and in 1891 succeeded César Franck as professor of organ playing at the Paris Conservatory. It was as organist of the Church of St. Sulpice, Paris (1869-1934), however, that he won a reputation as one of the greatest masters of organ technique and program-making. In 1910 he was elected to the French Academy of Fine Arts and after 1914 served as permanent secretary of that body. Among his compositions were ten symphonies and many suites, concertos, sonatas and chamber pieces. He also published *Technique of the Modern Orchestra* (1905). He died in Paris, March 12, 1937.

**Wild Life Conservation.** Notable progress has been made in the general field of wild life conservation during 1937.

**Whaling.**—The urgent need for stricter regulation of the whaling industry in order to conserve existing whale stocks, especially of certain rapidly diminishing species, has long been not merely a matter of sentiment, but of serious economic import to many nations of the world.

The international agreement for the regulation of whaling was signed at London, June 8, 1937. The signatories were the United States, Union of South Africa, Argentina, Australia, Germany, Great Britain, Irish Free State, New Zealand, and Norway. The agreement has been ratified by the United States, Great Britain, Norway, and Germany, and will become effective when ratified by a fifth signatory. It supplements the international convention for the regulation of whaling of 1931, now in force between the United States and 26 countries which are expected to become parties to the present agreement. The agreement forbids the kill-

ing of certain species below specified lengths. It forbids the killing of calves and of female whales accompanied by calves or suckling young. It limits the area and time within which certain types of whaling operations may be carried on. A record of whales treated by each factory is to be submitted to the international bureau for whaling statistics, in Norway, for the information of the signatory powers.

Some idea of magnitude and of economic values involved in the whaling industry may be gained from the operations of floating whaling factories of various nationalities in the Antarctic alone during the season from December to March 1937. Thirty factory ships and two land stations, with 194 killer boats, are reported to have taken about 40,000 whales from which were extracted 2,681,855 barrels of oil. The value of the oil is more than \$44,000,000.

**Migratory Bird Treaties.**—Migratory bird treaties in various forms had been pending between the United States and Mexico for more than 10 years. The convention for the protection of migratory birds and game mammals was signed in the City of Mexico, Feb. 7, 1936. This agreement became effective when ratifications by both countries were exchanged in Washington, March 15, 1937. It is similar to the migratory bird treaty with Canada (through Great Britain) in general terms but more comprehensive, and protection will be extended to about 140 migratory species not included in that agreement. Like the treaty with Great Britain, the convention with Mexico is to remain in effect for 15 years, after which it may be continued indefinitely, unless abrogated by one or the other of the nations by giving notice one year in advance.

**Migratory Bird Refuges.**—Seventeen new bird refuges were established by executive order in the United States during 1937, under a National program for migratory waterfowl restoration initiated three years ago. The number of Federal refuges is now 209, embracing about 4,500,000 acres. (See also BIRD REFUGES.)

**Federal Aid.**—The Pittman-Robertson Act, known as the Federal Aid to Wildlife Restoration Act (Public No. 415, 75th Congress approved Sept. 2, 1937), was the result of concerted efforts by wild life conservation organizations throughout the United States to provide means of restoring natural conditions for wild life, especially species hunted as game. Under the terms of the measure the secretary of agriculture is authorized to co-operate with the States, through their game and fish departments in the apportionment in accordance with specified conditions, of Federal funds for carrying out State wild life restoration projects.

For the purposes of the act, the revenue accruing during the fiscal year 1939 and succeeding years from the 10% tax imposed by section 610, title IV, of the Revenue Act of 1932 (47 Stat. 169) as amended, on firearms, shells, and cartridges is authorized to be set apart as "the Federal aid to wild life restoration fund." This fund will be available until expended.

During the fiscal year 1937 the amount collected under the tax was \$3,234,000, an indication of what may be expected in future years when the act will be in force. Of this total, not to exceed 8%, or \$258,720, would be authorized to be deducted for the administration of this act and the migratory bird conservation act.

(E. A. G.)

**Williamsburg Restoration.** The Williamsburg restoration at Williamsburg, Va., represents "an endeavor to restore accurately and to preserve for all time the most significant portions of an historic and important city of America's colonial period." The undertaking, envisaged by the Rev. W. A. R. Goodwin, rector of the Bruton parish church of Williamsburg, and begun in 1927, was made possible through the munificence of Mr. John D. Rockefeller, Jr. The work has

been accomplished through an exhaustive study of archaeological, architectural and documentary materials of the 17th and 18th centuries. Investigation was made by research workers in libraries and other repositories of American historical materials throughout the United States, England and France.

The selected area has been restored to its 18th century appearance and comprises Duke of Gloucester street, the principal thoroughfare of the city, and certain adjacent squares and greens upon which were located the colonial Capitol, the "governor's palace," the colony jail and other public buildings and numerous private residences. The more important of the public edifices, including the Capitol and the governor's palace, both of which had burned to the ground, have, with the exception of their brick foundations which remained, been entirely reconstructed from archaeological and documentary evidence. A number of the buildings required only slight alterations to restore them to their 18th century aspect. Of much assistance in the restoration of the major buildings was the discovery in 1930 of a forgotten copperplate engraving in the Bodleian library at Oxford university upon which was represented various elevations of these edifices.

Duke of Gloucester, "a noble great street" and one of the carefully planned thoroughfares of colonial times, extends seven-eighths of a mile from the College of William and Mary at its western to the colonial Capitol at its eastern extremity. The Wren building, the main structure of the college, was originally designed by Sir Christopher Wren and adapted "to the nature of the country by the gentlemen there." It is the oldest academic building in the United States and the only building in America designed by the great English architect. Its restoration, the first major project accomplished, was made a gift to the college by Mr. Rockefeller.

Altogether, in the restored area 507 buildings were wrecked, 21 were moved out, 122 have been reconstructed, and 67 restored and repaired. The educational purpose of the restoration has been emphasized at all times. (H. D. F.)

## Windsor, Edward, H.R.H. the Duke of

(1894— ), formerly H.M. King Edward VIII of Great Britain and Ireland; the eldest son of King George V, he succeeded to the throne on Jan. 20, 1936, but in view of the advice of his ministers that his projected marriage with Mrs. Simpson, an American citizen whose second divorce was then pending, was incompatible with his retention of the throne, he abdicated on Dec. 11 of the same year, leaving England for Austria, where he took up residence at Schloss Enzesfeld, the home of the Baron Eugene de Rothschild.

In Feb. 1937, the duke was visited by his sister, the princess royal, and her husband the earl of Harewood; and on March 29 he removed from Enzesfeld to St. Wolfgang. On May 4 he joined at the Chateau de Candé, near Tours, Mrs. Simpson (who had meanwhile resumed her maiden name of Warfield), the formalities of whose divorce from her husband Mr. Ernest Simpson, had been completed on the previous day, and on June 3 his marriage with Mrs. Wallis Warfield took place at the chateau, an Anglican clergyman performing the religious ceremony. It had been officially announced a few days previously that the style of "Royal Highness," enjoyed by the duke, would not be shared by his wife or descendants, if any. After the marriage the duke and duchess travelled to the Castle of Wasserleonburg, in Carinthia, for their honeymoon, remaining there until September, when they removed to Borsodivanka in Hungary, the home of Mr. Charles Bedaux, an industrial psychologist unpopular in American labour circles. At the beginning of October, during a visit to Paris, was announced the Duke's intention of visiting Germany and the United States to

THE DUKE AND THE DUCHESS of Windsor after their marriage at Monts, France

study social and housing conditions. The proposed visit to Germany followed at once, the duke meeting Hitler, Goebbels, and other statesmen in Berlin; but the visit to America was cancelled, on the eve of departure, strong opposition, largely on the ground of the association of Mr. Bedaux with the trip, having been expressed in the British and especially the American press. In November, an apology and damages were secured by the duke as the result of the agreed settlement of a libel action against the author and publishers of Mr. Geoffrey Dennis's *Coronation Commentary*, a book which contained certain unflattering observations on his royal highness.

**Windward Islands,** a British West Indian colony including Grenada, St. Lucia, and St. Vincent; language, English; capital, St. George's (Grenada); governor, Sir H. B. Popham. The area is 616 square miles. The population, predominantly negro and mulatto, was officially estimated at 205,804 in 1935. The chief cities are St. George's, 5,000, and Castries (St. Lucia), 20,000. The colony is administered by a governor and council, with subordinate executives and councils for each island. In 1936 imports totalled £650,963, 51% from Great Britain. Exports (cocoa, sugar, and other tropical agricultural products) were £627,400, chiefly to Great Britain (33%), the United States (23%), and Canada (19%). The monetary unit is the pound sterling.

**Wines.** There has been a notable expansion in the American wine industry since prohibition was repealed. It is estimated that the consumption of Californian wines in 1937 was 65,000,000 American gallons, compared with 53,834,364 gallons in 1936, 40,049,460 in 1935, and 26,166,091 in 1934. Last year 560 wineries crushed 494,000 tons of grapes and produced 53,160,688 gallons of wine.

Latest reports from the wine-growing districts of Europe indicate that the new wines are developing well. They confirm earlier

opinion crediting 1937 with having produced a vintage of exceptional merit, but also indicate that there are the usual and inevitable exceptions to the rule. Quality and quantity are indeed rarely found together in the world's vineyards, and the yield has been far from abundant. In the claret country the quantity is short, although not so short as some experts had anticipated, and the quality is good. This also applies to burgundy, where one report gives the quality as quite exceptional and the yield far below the previous year. In champagne the wines are said to be good, but the quantity "middling." Very fine hocks and moselles have been produced in diminished volume, but those who compare the German wines with the "wonder" year of 1921 are probably over-optimistic. Madeira has achieved fine wines without any drop in production. In Portugal the harvest was greatly aided by opportune showers prior to the gathering, and there is no doubt that the heavy rains of the last two winters have had a beneficial effect in maintaining the old vines in condition throughout the summer drought. The year 1937 also saw the arrival of the 1935 ports in England to be bottled and laid down for maturing. All the shippers have offered either the 1934's or the 1935's as a year. In the Jerez vineyards the harvest was gathered under wartime conditions. For some time past the bodegas have been denuded of workmen who have gone to join the fighting forces. Coopers find difficulty in getting staves for their casks, importation of these having been rationed. Indeed, the cost of all materials has increased enormously. Yet shipment of sherry to England continues increasing in volume, to meet the ever-growing demand.

In South Africa the vintage is harvested in the English spring, and this applies to Australia and the other wine-growing countries of the Southern hemisphere, of which Chile is the most prominent.

**World Production.**—The short harvest of 1937 follows a period in which conditions have favoured heavy yields. For the five years prior to 1933 the world's average annual production was 173,000,000 hectolitres. In 1934 it was 211,000,000 hectolitres, and in 1935 222,000,000 hectolitres; and this swollen production was achieved without any appreciable increase in the area under vines.

About 90% of the world's harvest is produced in Europe. France, Italy, Spain, Portugal, and Germany are the chief exporters and producers. With the exception of Algeria and Chile (which export considerable quantities) and South Africa and Australia (which find a good market in the United Kingdom) the yield elsewhere is almost exclusively consumed in the countries of origin. (D. F. C.)

**Wire Photos:** see PHOTOGRAPHY: *Special Applications*.

**Wisconsin,** the fifth and last State to be created under the Ordinance of 1787, is popularly known as "the Badger State." It has an area of 56,066 sq. mi., and the population in 1930 was 2,939,006. The capital is Madison, population 57,899; the largest city, Milwaukee, population 578,249. Urban population numbered 1,553,843, all whites except for 9,873 negroes and 3,692 of other races. The rural population, 1,385,163, contained only 866 negroes and 10,716 of other races, practically all Indians settled upon reservations. There were 386,213 foreign-born whites. In rural society native whites of native parentage constituted 44% of the whole, native whites of foreign parentage 40.5%. In the urban population, native whites of native parentage were 35.7%, those of foreign parentage 43.4%. The foreign-born made up 20.4% of urban, 14.8% of rural population.

**History.**—Wisconsin territory was created by Congress April 20, 1836. The population at that time was 11,683. Lead miners and smelters, who were largely from Missouri and Kentucky,

dominated territorial politics for some years, but were superseded by the rapidly increasing agricultural and village population of the south east—the Yankee element. By 1848, when Wisconsin entered the Union, the Yankees were in control politically, industrially and socially—a position they maintained till about the close of the 19th century. Lumbering, shipping, general manufactures, railroad building, were all promoted largely by Yankees.

#### Political Changes.—

Foreign elements gradually gained in importance. Germans, Scandinavians, Poles, Bohemians, and others entered Wisconsin in such numbers that by 1890 she was often referred to as a German commonwealth. The foreign born being most largely farmers or labourers, "common people," were not wholly sympathetic with the dominant element which they considered aristocratic and exploitative. Rendered suspicious and intractable by legislation affecting religious education, and by the legally permitted exactions of railroads, the common people revolted under the leadership of the late Robert M. La Follette.

**Legal Changes and Officers.**—Among the first fruits of the movement was Wisconsin's primary election law followed by much meliorative and regulative legislation. The constitution adopted in 1848 is still the State's fundamental law, but numerous amendments, by two successive legislatures, have been adopted. A vital one permits the governor to veto single items in appropriation bills. The officers elected in 1936 were Philip Fox La Follette, governor; Henry A. Gunderson, lieutenant-governor; Theodore Dammann, secretary of State; Solomon Levitan, State treasurer; and Orland S. Loomis, attorney-general. The election represented a triumph for the newly organized Progressive Party, which also gained a controlling voice in the legislature. But Roosevelt, Democratic candidate for President, received 802,984 votes to Landon's 380,826, and 74,748 for all others.

**Education.**—Yankee control of the new State insured a careful regard for its educational interests. Despite some mismanagement of the school fund arising from the premature sale of the school lands, the laws compelled the general maintenance of common schools, a high school system was superimposed upon them, and a State university, coeval with the State, caps the system. Agricultural and industrial education have been stressed, and there is a system of vocational instruction for adults.

**Hygiene and Corrections.**—A board of control which governed all penal and charitable institutions was abolished by recent legislation, its functions being divided between a Department of Mental Hygiene and a Department of Corrections. The State has a system of old age, widows, and teachers pensions; it maintains a hospital for crippled children and affords them other aids; and it has met the problem of outdoor relief during the depression by co-operating with the Federal relief departments.

**Banking and Finance.**—A banking commission of three members is empowered to examine banks, and loan associations of all kinds, and to control the conditions under which closed banks can reopen. It also handles Federal assistance to banks. Many banks which succumbed to the depression have been stabilized through refinancing under the commission's direction. Building

PHILIP F. LA FOLLETTE, governor of Wisconsin

and loan organizations, an important factor in financing homes, are controlled by the banking commission as are sales financing, credit unions, and small loan and discount companies. State business is controlled by a State budget bureau.

**Agriculture, Manufacturing, Mining.**—Wisconsin's agriculture centres in dairying. The product of her farms in 1936, including only crops and milk, was valued at \$375,000,000, about \$175,000,000 of which was credited to milk reckoned at farm price values. The State leads all States in production of cheese. Mining, once very important in the lead region, is now a minor interest, though northern Wisconsin shares to a small extent in the iron and copper deposits which are of such great importance in the neighbour States of Minnesota and Michigan. The State's manufactures, which include lumber, paper and pulp, furniture and wooden-ware, farm machinery, engines, automobiles, electrical appliances, etc., greatly exceed in value her agricultural productions. In 1935 she stood tenth among the States in aggregate value of manufactures. (J. Sc.)

**Wisconsin, University of.** The university at Madison, Wis. continued during 1937 its thorough survey of different scientific fields under its unique science set-up, the science inquiry, through which faculty members attempt to review the teaching and research work of the university in the natural and social sciences in terms of their relation to the political, social, and economic problems of the time, and particularly of the State. Four studies published by the inquiry during 1937 dealt with the conservation of minerals, the fight against crime, the conservation of wild life, and transportation. The Wisconsin Alumni Research Foundation contributed a total of \$163,000 to the university's research funds, which were used to support about 80 old or new science research projects carried on under the direction of faculty members.

America's first state-wide school for workers was established by the university. Designed to provide Wisconsin workers with an opportunity for organized study during the entire year, the new school had an enrolment of 1,116 students in 63 different classes conducted weekly in 26 Wisconsin communities by the end of the year. A new department, known as "the University of Wisconsin Press," charged with the duty of publishing books and bulletins based on the studies and reports of faculty members was established during the year. A new phase in nuclear research was reached at the University of Wisconsin during 1937, through the work of several scientists in developing high voltage atom-smashing equipment with superior advantages over those so far used in this field of scientific research. A generator giving a bolt of lightning at 2,700,000 volts, which is the highest steady voltage that has ever been attained and actually used in atomic disintegration, was developed by the Wisconsin physicists.

The eleventh president in the 90-year history of the university, C. A. Dykstra, city manager of Cincinnati, Ohio, for seven years, took office on July 1, 1937. The university's enrolment reached a new record in the fall of 1937, when 10,800 students registered. (C. A. Dy.)

**Wise, Thomas James** (1859–1937), British bibliographer and book-collector; born October 7. After a private education, he was engaged in business in the London produce market; but all his leisure, and all the available balance of his gradually increasing income, was devoted to his scholarly passion for the collection of first editions in their original condition. His widely famous collection, the Ashley library, is particularly rich in such original first editions of the English poets and dramatists from the Elizabethan age onwards. This library was acquired, some months after his death, by the

British museum. In addition to the 11 volumes of the Ashley library catalogue, Wise published bibliographies of several English poets and novelists, edited Spenser's *Faerie Queene*, and collaborated with Sir William Robertson Nicoll in *Literary Anecdotes of the XIXth Century*. He died May 13, 1937.

## Women's Clubs, General Federation of.

Survey of the many activities of the Federation in 1937 notes particularly the work against crime by the Department of Education, the chairman of which is Mrs. John L. Whitehurst, who in more than 100 meetings in 35 States pointed out the startling facts that in the United States persons under 21 years commit 13% of the murders, 28% of the robberies, 41% of the burglaries, and 51% of the automobile thefts. The Department in American Citizenship, Mrs. Jefferson D. Atwood, chairman, was active against proposed legislation to reduce Federal civil service. The drive against traffic accidents, which the Federation's safety committee, Mrs. Edward Hammett, chairman, has taken to the 15,000 federated clubs, was given further impetus in 1937 in campaigns for drivers' licenses in all States and with a prize offered for the club making the greatest contribution to the prevention of highway accidents. National officers of the Federation are: president, Mrs. Robert Campbell Lawson, 1734 N Street, N.W., Washington, D.C.; first vice-president, Mrs. Saidie Orr Dunbar, 605 Woodlark building, Portland, Ore.; second vice-president, Mrs. Walter W. Seynour, 1726 Euclid avenue, Chicago, Ill.; recording secretary, Mrs. John S. Harvey, 1325 Sixth avenue, Huntington, W. Va.; treasurer, Mrs. Elvella Dickinson, 60 Roxbury street, Keene, N.H. The annual convention at which officers are elected will be in Kansas City, Mo., May 10-17, 1938.

**Wool.** The biggest commercial change in the wool industry of recent years has been the effect of State trading on a large scale. In the totalitarian States, the Governments completely control wool buying. Moreover, the policy of self-sufficiency adopted by them has led to the introduction of a number of blood sheep stocks from Great Britain and the British Colonies into the U.S.S.R. and Manchoukuo, and to the large-scale production of wool substitutes in Italy, Germany, and Japan. As a result, these States are now less important internationally as wool buyers.

Politics have therefore, by bi-lateral trade agreements, quotas, currency control, etc., affected, not only the commerce in raw wool from such countries as Australia, Argentina, New Zealand, the Union of South Africa, and Uruguay (producers who consume only about 5% of their production), but also the export trade in manufactured or semi-manufactured goods from the industrial countries. Of the latter, virtually only two, the United States and the United Kingdom, are both wool producers and large-scale consumers; and of these the United Kingdom, which has the largest number of looms of any country in the world, is the only large exporter. In the United States, owing to high tariffs and high production costs, most of the output is consumed domestically.

**Great Britain and the Wool Industry.**—In Britain the post-war effects of foreign tariffs and currency restrictions on the export trade were to some extent offset by the institution in 1931 of import tariffs, which saved a considerable part of the industry from extinction, attracted French, Belgian, and German capital and technicians to the country, and resulted in an increase in continental types of machinery and much greater British purchases in overseas markets of types of wool that had hitherto been

regarded as suitable mainly for the Continent. Internal reconstruction by the process of the buying and scrapping of redundant plants has been successfully carried out in one section of the trade through the Woolcombers' Mutual Association. British mills and textile personnel today are somewhat fewer and output smaller than the possible output of twenty years ago. A notable commercial-financial event has been the growth of multiple tailoring, with a greater mass purchasing than would have developed on the price level of bespoke garments. The multiple tailors are now the highest individual consuming firms of wool, and their buying largely has set the pace for the rest of the trade.

**Wool Research.** In recent years many problems have been elucidated and considerable advances made in systems of rendering wool garments unshrinkable and non-irritating. To promote research and, if necessary, the advertising of wool, Australian, New Zealand, and South African wool growers have recently agreed to a levy on each bale of wool they produce, or more prompted by the rapid rise in European rayon staple fibre and other wool substitutes, although it is still undecided whether the substitutes are really of wool or in competition. Italy's substitute "lanital" is made from milk; in such quantities that the latter has to be imported for the purpose. Germany, Great Britain, Japan, and the United States manufacture wool substitutes from wood pulp. None give the same effect as wool, being mostly deficient in elasticity and warmth, in spite of all the efforts of chemists to reproduce wool characteristics.

**World Trade in Wool.** During 1935, 1936, and 1937, owing to political, labour, and currency troubles, France's consumption dropped considerably. Belgium has had a much steadier employment. After a rapid rise to the position of second most important customer of Australia, Japan fell away during 1936, and in 1937, preoccupied by war needs, was taking very little. America only enters the international wool market violently and erratically. During 1936 there was no appreciable increase in the total volume of the world's exporting trade in wool goods. Countries that bought more wool appeared to do so to satisfy demands of home consumers only. Britain retained wool imports were the highest of recent years, and America's takings also increased, while those of France, Germany, Japan, and Russia all declined. About one third of the exports of the five chief raw wool exporting countries were consigned to the United Kingdom, Japan remaining the second largest importing purchaser. The United Kingdom and the United States are the two largest consumers from all sources.

## World Armaments.

From the point of view of armaments, the course of history since the end of the World War falls into three fairly distinct phases. Immediately after the War, a combination of exhaustion and idealism led the Powers to limit or reduce their expenditure on armaments. The Washington Naval Treaty represented the high-water mark of this period. There were always exceptions to the rule, notably certain smaller Powers in the South-east and East of Europe, to whom the thrifty French, under the aegis of the late M. Poincaré, made lavish loans for armaments. The quiescent period may be said to have been closed by the failure of the Geneva Naval Conference of 1927 and the consequent retirement of Lord Cecil from the British Cabinet. With this turning-point for the "realists," a somewhat indefinite period ensued; the advocates of

new international order fighting at rear-guard action against the "realists." Finally the latter came into their own with the Japanese invasion of Manchuria in the autumn of 1935, from that point the international situation has progressively deteriorated, and the world's armaments bill has been continually inflated. Among the main factors which have promoted these movements, the increased expenditure on armaments is directly attributable, the advent of the Nazi régime in Germany and the Italian invasion of Ethiopia stand out. The extent to which expenditure on armaments has been increased varies from country to country. Germany has particularly disarmed under the provisions of the Treaty of Versailles, but almost certainly learned to a much greater extent than any other Power. Official figures of German armaments are plentiful, but Nazi Germany are not available, but comparing the figures of 1936-37 with an unofficial estimate for 1934-35 would appear that such expenditure was ten times more in the latter than in the earlier period. In the case of France, though a large proportionate increase, it is not so great as in Germany, because her disarmament was characterized by extreme caution; her estimates for 1937 nevertheless represented "the highest ever in peacetime history." Nor, in the case of France, is it sufficient to examine budgetary figures to ascertain her defence expenditure; for, ever since the construction of the Maginot line, she has been obliged to finance outlays which are deemed to be in the nature of special expenditure by means of special allocations, for which the funds are provided by loans. In 1937 national defence will be increased from 14 billion to 16 billion francs annually, and from an extraordinary capital expense budget which almost equals the ordinary military budget. It should be emphasized, however, that the last reference is to the budget estimate for the army only, not the total defence estimates. More need be said of the world's armaments bill. Wherever we look, the same story repeats itself. In 1936-37 the defence expenditure of Great Britain was £1,960,000,000, the 1936-37 estimates were for £2,930,000,000, and the 1937-38 for £3,100,000,000. In 1934-35 the Japanese expenditure on armaments amounted to ¥34,000,000,000. In 1936-37 the budget provided for ¥39,400,000,000, and in 1937-38 the United States expenditure amounted to \$699,400,000; in 1937-38, comparatively inflated as the United States is from European standards, if they choose, Asia's estimate of expenditure was \$997,000,000. In the case of Italy, the estimate for 1936-37 was 1,000,000,000 lire, and 1937-38 1,100,000,000 lire. The latter figure, however, is a preliminary estimate, for the respective figures are ¥3,450,000,000 lire and ¥3,752,000,000 lire, but the latter figure does not include expenditure on colonies or on Ethiopia, and, apart from that, an official estimate for 1935-36 (the year of the Italian Ethiopian campaign) is ¥3,610,000,000 lire. In 1936-37 it was ¥3,750,000,000 lire. The international menace of these huge armaments is a commonplace. They aggravate the disease which they are designed to cure. The strain which they impose on the economic system is an equally serious aspect of the matter. In 1936-37 the total armaments bill for 1936-37 is accounted for 20% of the estimated budget expenditure; in France in 1937 the proportion was 29.7% (excluding 20% of the special accounts), in Japan in 1936-37 the proportion was as high as 46.6%, in the U.S.S.R. in 1937 it was 20.7%, and in the U.S. for 1936-37 it was 14.4%. Official figures are not available for Germany and Italy, but General Göring's statement of 1936 before the Reichstag speaks for itself, as does also Signor Mussolini's capital levy, making the year 1937-38 the proportion of defence expenditure to total expenditure in the respective countries are as follows: Great Britain 16.8; France 16; Germany 65; Japan 27; Japan 30.9; U.S.S.R. 19.3; U.S. 14.4; 1937-38 21.2; 1936-37 20.7; 1935-36 19.3; 1934-35 18.1.

<sup>1</sup> The figures are in millions of lire. <sup>2</sup> The actual cost being £1,860,000,000.

In wealthy, highly industrialized countries like the U.S., and Great Britain, the strain is of course less great than elsewhere; and its action is delayed. Rearmament, coming in both countries, as it did, at a time of industrial slump, undoubtedly gave industry, more especially the stagnant heavy industries of Great Britain, a welcome and necessary tonic. From an immediate point of view, probably the worst that could be said about the rearmament of Great Britain is that it has diverted public funds which could otherwise have been used for socially beneficial public works such as rehousing, that it has robbed the income-tax payer to pay the steel manufacturer, and that it has led to delayed deliveries in ordinary commercial contracts. From a longer point of view it has not only swollen the public debt, but it has also probably led to that excessive expenditure on capital goods which causes a boom and, when the demand becomes less brisk, inevitably leads to a slump. A concern which has ample resources and can afford to take a long view will be able to wait to do its buying till the selling is not so good; but most ordinary concerns want to do their buying and their selling quickly, and by doing so intensify both the boom and the danger of a consequent slump.

In Great Britain the economic consequences of rearmament are, in so far as they are bad, rather intangible and remote. In Germany they are neither. General Göring's slogan is a clever attempt to impart a heroic flavour to plain human misery. Its reverse side is the necessity of distributing winter relief to millions of Germans. The whole economic system is dislocated in order to enable Germany to pay for imports, such as copper and nitrates, which are necessary for her in enormous quantities in order to keep her armaments and munitions factories working at the pressure at which they have been kept from 1935 onwards. The situation is reminiscent of the story of the two men who flew from Moscow to Kiev during the first five-year plan to see if there were any eggs there; there were none. Russia had exported all her eggs in order to buy aeroplanes. In most of the other countries of the world the economic effect of rearmament resembles the effect on Germany rather than the effect on Great Britain.

The Great Powers have not been alone in rearming. The smaller Powers of Europe, Asia, and America, and the British Dominions have followed suit. It is significant that the recent general election in Australia was fought largely on a defence issue which involved, among other things, a decision as to the type of rearmament which the Commonwealth should carry out. In all, measured in dollars (1936 parity), the world's defence expenditure rose from \$4,067,200,000 in 1931 to \$10,730,700,000 in 1936.<sup>1</sup> This expenditure must be responsible for a substantial part, at least, of that rise in the price of commodities which has taken place since 1931. The effects of this rise have on the whole been beneficial, but, in so far as it has not been due to expenditure of a frequently recurring nature, it must be short-lived and conduce to that economic instability which is so potent a factor for war.

In this connection it will be of interest to examine some of the ways in which the leading rearming Powers have allocated their expenditure. Certainly one of the most striking increases since 1931 is in sums which many of the Powers spend on their air forces now, as compared with then. Germany had no air force in 1931. She is now, perhaps, the greatest air Power in the world, and while no authoritative figures are available either as to her defence expenditure or as to the material actually in use, one of the most striking aspects of her strength is her capacity for the rapid building of aeroplanes; this capacity has

been rated at between 400 and 800 aeroplanes a month.<sup>2</sup> This must clearly involve a very high degree of capital expenditure, the creation of a plant and an organization which are not normally working at anything approaching full pressure. Information as to manufacturing capacity is, for obvious reasons, not easy to obtain in connection with any Power; but, to put it at its lowest, it is at least a reasonable guess that other Powers have to some extent followed Germany's example, for in the present state of invention, and in view of the wastage which would inevitably occur in war, the capacity to build aeroplanes quickly is almost the vital factor in a nation's air strength. And some indication of the extent of expenditure of this kind is provided by the British air estimates for 1936-37, in which "technical and warlike stores" and "works, buildings, and lands" were jointly responsible for a total of £35,896,000.

Outside air forces, it is equally clear that immense sums are being spent on objects which cannot, in the nature of things, recur except at very long intervals or in time of war. The naval construction programs of the United States, Japan, and Great Britain; Great Britain's expenditure on the Singapore base and on the strengthening of the Mediterranean bases; France's "special treasury accounts" which financed the construction of the Maginot line, and in 1937 were estimated to comprise extraordinary expenditure of a total of 9,448,300,000 francs; above all, the astounding efforts which raised Germany to "a commanding position of military power" by the end of 1936, only 21 months after the denunciation of the military, naval, and air clauses of the Treaty of Versailles; all these must be responsible, with other factors of the same kind, for a dislocation of the world's economic system which has no parallel except in the War of 1914-18. Great Britain, France, Germany, Japan, Russia, and the United States are certainly all spending twice as much on defence as before the War—Germany, it is estimated, about six times more; and Italy's defence expenditure has also increased very substantially. While the preparations for the next war have for the time relieved the slump which was the direct consequence of the last, the same causes produce the same effects, and it is almost impossible to avoid the fear that the near future will see another period of economic stringency which may drive discredited rulers to desperate courses. (W. T. WE.)

**World Commerce:** see EXPORTS AND IMPORTS.

**World Court:** see PERMANENT COURT OF INTERNATIONAL JUSTICE.

**Wrestling.** Amateur wrestling in the United States showed further improvement at the colleges and athletic clubs in 1937. In 1938 the amateur championships will be fifty years old. They were held for the first time in 1888 and annually thereafter except 1892 and 1898. However, two meets were held in 1889, which brings the total to fifty.

The A.A.U. national championships at Baltimore did not have as large an entry list in 1937 as in those years when the nearness of approaching Olympics served as a magnet, but competition was keen and every championship was closely contested. Title winners in the various classes represented seven different States from New England to the Pacific coast. At the national collegiate meet at Terre Haute, Ind., Oklahoma agricultural and mechanical college won the team championship, securing four individual titles and ranking second or third in three of the other four weight divisions.

Professional wrestling had one of the most unsuccessful years in its history, with attendances far below normal. This falling off was attributed to constant squabbles among promoters, and unwillingness or inability to meet financial demands, which caused some of the headliners to seek engagements in countries where the inducements were more attractive. (J. B. P.)

**Wyoming,** a Rocky mountain State, was admitted to the United States July 10, 1890, as the forty-fourth State. Popularly known as the "Equality State," it has a land area of 97,548 square miles. According to the 1930 U.S. census, it had a population of 225,565; while a Census Bureau estimate of July 1, 1937, placed the population at 235,000. Its capital city, Cheyenne, had (1930) a population of 17,361, and Casper, another large city, 16,619. Of the State's 1930 population, 70,000 or 31% were urban; 214,067 whites; 1,250 negroes; 10,248 other races; 194,469 native born, and 19,658 foreign born. Wyoming is peculiarly situated on the backbone of the continent, where plains and mountains meet, and for more than a century has been the gateway to the west and north-west.

**History.**—Elective State officials in 1937 were governor, Leslie A. Miller; secretary of State, Lester C. Hunt; State auditor, William Jack; State treasurer, J. Kirk Baldwin; and superintendent of public instruction, Jack R. Gage.

**Education.**—Educational facilities in Wyoming serve the needs of the younger generation not alone in the grade and high schools, but in the higher branch of education which may be found at the State university and agricultural college at Laramie. The university enrolment for the year 1937-38 included 1,840 full-time and 985 part-time students. There was a faculty of 139. Elementary and high school attendance exceeded 55,000 with nearly 3,000 teachers.

**Agriculture, Manufacturing, Mining.**—Despite the sparse settlement of the State, its industrial development has been extremely diversified. Production figures reached \$45,289,546 in 1935, of which \$24,653,827 represented petroleum refining. The State's agricultural development has been chiefly in live stock, with the live stock income for 1935 standing at \$32,330,000. Products of the soil, however, through intensive crop measures have produced and continued to produce the highest quality of sugar-beets, potatoes, grains and other commodities, the 1,463,000 acres in 1936 producing crops valued at \$21,740,000.

Farm products such as beef, dairy products, mutton and wool, poultry and eggs have a leading position in the State. Oil and coal have been the chief minerals of the State, providing employ-

ment for thousands of its citizens. Of the State's mineral production of \$30,669,658 in 1935; \$11,730,000 was petroleum and \$11,127,000 was coal.

Recreationally, Wyoming is outstanding. Great strides have been made during the past dozen years by Federal, State and private interests in the development of wild life and recreational values, not alone for the benefit and enjoyment of its local population, but for the thousands of citizens of the nation. Climate and environment are particularly suited to worn minds and for the reinvigoration of those seeking relief from bodily ills.

LESLIE A. MILLER, governor of Wyoming

During 1937 the State gave serious attention to the development of its land and water resources and a program for its gradual and ultimate use has been perfected so that the greatest amount of benefit may accrue. This contemplates a long-range program which in the end will provide homes and subsistence for an increasingly larger population, the creation of additional capital wealth and a levelling and diminishing tax structure so that the governmental burden shall fall with less penalty upon all.

Highway development in Wyoming has not lagged behind other States. During the past 20 years \$50,000,000 has been expended for construction of highways alone, and this figure does not take into consideration maintenance costs. During the calendar year 1937 approximately \$6,000,000 went into highway construction. At the present time there are 3,700 miles of State Highways of which about 3,000 miles have been paved with oil. (L. A. M.)

**X-Ray.** The diagnostic value of the X-rays has been increased in recent years by improvements in apparatus and discovery of new methods of examination.

The rotating anode tube has gradually been perfected and is now coming into general use. Due to the small focal point of these tubes, roentgenograms may now be obtained with much sharper and richer detail than was formerly possible. They also permit use of currents of higher milliamperage with consequent reduction in time of exposure. This is of great value in X-ray examinations of children and of organs or parts which cannot be immobilized.

The kymograph is an instrument which is now coming into general use as an aid to diagnosis. Kymography consists in making roentgenograms of moving parts or organs, such as the heart, stomach or diaphragm through a grid consisting of lead strips separated from each other by equal distances. The roentgenogram is made while the grid is moving at right angles to the long axis of the lead strips and reveals the nature and degree of movement of the heart or other organ under examination. It is especially valuable in differential diagnosis of diseases of the heart and other structures within the chest.

Tomography is a method of roentgenography which results in producing a distinct picture of a selected layer of the body. It is accomplished by means of co-ordinated movements of the X-ray tube and the film carrier around the part of the body under examination.

**Therapy.**—That many cases of cancer can be cured by means of the X-rays and radium is now established. It has been known

"ENDEAVOUR II" (left), English challenger, and "RANGER" (right), U. S. cup defender, which won the 1937 yacht races for the America's Cup. The picture is from the third race in the series off Newport, Rhode Island

breezes, the "Lecky," from San Diego, Cal., sailed by Milton Wegeforth, won with 164 points; the German entry "Pimm," owned by Walter von Hutschler being second with 159 points. "Pimm" won four of the five races and only lost the championship by being damaged in the first race. "Pimm" used an ingenious arrangement for flexing her very light mast and bending her boom, which resulted in her being able to flatten her sail going to windward and yet, by straightening the mast and bending the boom, horizontally, giving it plenty of draft when off the wind. The result has led to much experimenting in the class to get the same effect on the American boats.

**A New Class.**—Among the new classes of small racing yachts to make an appearance in 1937, the most important was the International One-Design Class, sailed during the summer on Long Island Sound. These little boats were designed by Bjarne Aas and were built in Norway. They are 33'2" long over all; 21'5" on the water; 6'9" beam; 5'4" draft and carry 416 sq.ft. of sail. Twenty-five were originally ordered, and the class has since been adopted at Northeast Harbor, Maine, and at Bermuda.

**Long-Distance Racing.**—In the long-distance and ocean-racing events, there were two outstanding races. These were the 475-mile run from New London to Gibson island, in which Walter Rothschild's "Avanti" won in a fleet of 35 starters, and H. P. Wells' "Golden Eye" took the honours in the small B Class; and the annual Chicago-Mackinac Race of the Chicago Yacht Club. "Avanti," a Stephens-designed yawl, was one of the successful boats whose model was given a tank test before building. In the latter event the fleet ran into a gale which scattered the yachts badly so that only a few finished. The winners were R. P. Benedict's "Southern Cross," Class A; N. Rubinkam's "Rubaiyat," Class B, both designed by John Alden; and the "Revenge," Walliser-Griffin, in the racing division. (H. L. St.)

**Great Britain and Europe.**—With racing interest centred largely on the America's Cup, 1937 has been a year of promise rather than performance in Europe. Without its most interesting vessels, the big (J) class did not race in British waters, the 12-metre class heading the program, as it will probably continue to do, although the effort, still unsuccessful, to evolve a 65-foot (L) class, less expensive than the (J) boats, attracted great attention. In Britain the racing was greatly influenced by the Coronation International Regatta at Torbay which lasted a fortnight, and which collected no fewer than 312 entries, the biggest known in the history of British yachting, divided into 17 classes. The weather was excellent, and most of the racing very interesting; only the number of overseas visitors was rather disappointing. The waning popularity of the international metre classes is conspicuous, largely through cost, but an important step was

made by the International Yacht Racing Union laying down a definite minimum beam restriction, otherwise the rapid tendency, especially in Scandinavia, towards the "plank-on-edge" could only have killed the international rule in time. The minima laid down are lenient, but the policy is sound. The British tendency is towards numerous local classes, either restricted or one-design, and there is a vogue for foreign designers, but many of these classes will probably be very short-lived. The programs in 1937 offered plenty of handicap racing, but there is a demand for better general organization on that side.

Off-shore or "ocean" racing continues to attract numerous yachtsmen, and the year saw a number of excellent contests. This form of racing has produced many very interesting yachts in recent years, and has permitted a number of the younger architects, whose names were almost unknown a few years ago, to make high reputations. Very conspicuous among the new fast cruising yachts is the Clyde-built ketch "Thendara," 145 tons, which aroused unbounded admiration when she made her début at Torbay, and showed a fine turn of speed in the handicap races.

During 1937 building was checked by the rapid rise in building prices, which has undoubtedly prevented the placing of many orders, although the enthusiasm for the fast cruiser, and the scope that it gives to both builder and yachtsman, has caused several contracts to be placed. Apart from these off-shore and class racers, most of the new yachts have been full-powered motor vessels of various types, among the most interesting being Mr. Sopwith's "Philante," of over 1,600 tons displacement, and the inland waterway yacht subscribed for by the people of Holland as a wedding present for Princess Juliana. (F. C. Bo.)

## Yale University.

President James Rowland Angell's 16-year term as President of Yale University closed at Commencement, June 23, 1937, and his successor, Charles Seymour of the Yale Class of 1908, elected Feb. 13, was installed on Oct. 8. Yale's new president, a graduate of Cambridge University, England, in 1904, historian of the World War and an

American delegate to the Peace Conference in 1919, had been provost and Sterling professor of history and master of Berkeley College, and actively at the forefront of the university's physical and intellectual development since 1921.

In June Dean Edgar S. Furniss of the Graduate School became provost; Dean Clarence W. Mendel of Yale College retired, Professor George H. Nettleton of the department of English taking his place for one year; Dean Percy T. Walden of freshman year retired, Professor William R. Longley of the department of mathematics becoming acting freshman dean. Professor Samuel B. Hemingway of the department of English was appointed master of Berkeley College.

During the year three large gifts were announced: the anonymous Jane Coffin Childs Memorial Fund for Medical Research, the amount of which, unannounced, is said to be the largest single gift ever made to Yale for work in the field of science; the bequest of \$380,000 by the late George St. John Sheffield, B.A., 1863, for general endowment of the Sheffield Scientific School, and that of the late Noyes B. Clark, Ph.B., 1891, of upwards of \$500,000 to aid poor students who without such help could not enter the university. The Yale Alumni Board completed new plans, including graduate publications; and the Class Secretaries Association changed its system to meet the needs of the nine residential colleges, combining all undergraduates into one class for secretarial purposes.

In 1921, when President James Rowland Angell came to Yale University, the university's endowments amounted to \$25,000,000. As President Charles Semour succeeded, the endowments, including the great foundations received since 1921, totalled approximately \$105,000,000. (E. Ov.)

**Yemen:** see ARABIA.

## Young Men's Christian Association.

The world's alliance of Young Men's Christian Associations was formed in 1855. It is composed of 36 autonomous national alliances and associations in 28 other countries affiliated informally. The headquarters of its world's committee and executive are located at Geneva, Switzerland. Its 21st world's conference met in Mysore, India, in Jan. 1937. Representatives from Belgium, England, France, Germany, Holland, Switzerland and the United States formed the original alliance in 1855. Reports from all countries (Jan. 1, 1937) showed 10,308 associations with 1,761,456 members, predominantly young men and boys. A body of secretaries or professional workers numbering 5,546 was reported, two-thirds of them employed in the United States. Buildings owned and occupied numbered 1,664. Concerns of immediate importance to the alliance include the contribution of Christian youth to a Christian world order, public questions affecting the place and opportunity of youth and the family in the social order, and the emergence of a universal Christian community. Publications: *Youth in the New World*, *Flaming Milestone*, *World's Youth*, a quarterly journal, are published by the world's committee, Y.M.C.A., Geneva; *Y.M.C.A. Year Book* for 1937, National Council, Y.M.C.A., New York. (O. E. P.)

**Young Men's Hebrew Association and Young Women's Hebrew Association:** see JEWISH WELFARE BOARD.

## Young Women's Christian Association.

During 1937, the World's Young Women's Christian Association with its headquarters in Geneva carried on its usual program of advisory service and co-ordination of the work of its

constituent associations in 52 countries, which reach a total membership of more than 1,000,000 women and girls.

Two executive committees were held in Geneva, with representatives of at least 15 nationalities. Following the regular plan adopted in 1934, two significant regional conferences were held: the North America Area Conference, April 28-30, in Toronto, including Canada, U.S., Mexico, Newfoundland, with Java as an invited guest; and the Conference of northern Europe at Nyborg Strand, Denmark, July 24-31, with nine countries represented.

Three new areas (Iran, Siam, and Fiji) for development of the Young Women's Christian Association were given special consideration, as the result of special requests from these areas for the advice and help of the World's Y.W.C.A.

Representatives from the World's Y.W.C.A. attended the following conferences: the Far Eastern Conference on Traffic in Women and Children in Java, Feb. 1937, under the League of Nations; the Pan-Pacific Women's Conference in Vancouver, Canada, July 12-24; the Conference on "Church, Community, and State" at Oxford, England, July 12-26; and the World Conference on Faith and Order at Edinburgh, Aug. 3-18.

Further progress was made in the two special subjects of study carried on through the World's Y.W.C.A.—The Christian Emphasis, and the Place and Contribution of Women. The joint work of the World's Y.M.C.A. and World's Y.W.C.A. was also a subject of study by a special commission.

The past year realized a significant advance in bringing the associations of the East and West into closer relationship through the direct collaboration of the general secretary of the Y.W.C.A. in Tokyo for six months on the staff of the World's Y.W.C.A. The year as a whole was significant for the world movement because of progress along many lines towards the goal of a more closely integrated world movement. (R. F. Wo.)

**Youth Movements** were unknown before the 20th century. They are an expression of the conscious acceleration of the dynamic changes of the contemporary world, of the widening rift in experience and feeling between generations. As its consequence youth revolts against the guidance by the older generation, organizes to find its own new forms of life and proclaims its own ideals as opposed to or at least different from those of the parental home and the school.

Youth movements originated before the World War in Germany. The Wandervogel was a non-political organization aiming at a life in closer contact with nature and cultivating folk-songs, folk-dances, and other popular forms of a new artistic feeling. After the World War, in the newly arisen totalitarian States, in the Soviet Union, in Fascist Italy, in Nazi Germany, youth was organized on a "totalitarian" basis, denying it the spontaneous and autonomous character which is the essence of true youth movements. In these countries the youth organizations became the most important instrument for the indoctrination of the rising generation by the official party leadership and formed the reserves for the party. In the Soviet Union the two youth organizations, the Comsomols (Communist League of Youth) for those over 15 years of age and the Young Pioneers who range from 10 to 16 years of age are built upon a principle of selection, to be the "vanguard" in the construction of the new order. In the Fascist States, the youth organizations are all-inclusive, and all children are invited or forced to join. In Germany boys and girls formed the Hitler Jugend and the Bund Deutscher Maedel. Italian Fascism glorified youth from the beginning in its official song, *Giovinezza*. It organized all children from the age of six in strictly militaristic organizations, the backbone of which formed the Balilla, with the Wolf-Cubs for the younger and the Avanguardisti for the older children. Youth serves here as a

simple instrument for military and party aims.

True youth movements are confined today, 1937, to the democratic countries which allow them freedom of self-expression. The greater political and economic stability in these countries has not favoured the growth of important youth movements. The progressive social structure of democracy seemed to allow sufficient scope for the expression and expansion of youth without leading to its revolt. Only in the United States the growth of a youth movement was hastened by the economic depression and the social crisis of the early '30s.

In 1934 the American Youth Congress was founded in New York as "a permanent federation of youth organizations formed for the purpose of initiating, co-ordinating, and unifying the activities of the youth organizations of America in relation to their common problems." It held its fourth annual meeting in July 1937 at Milwaukee, Wis. It proposed to the 75th Congress an American Youth bill for better educational opportunities. Other important American youth movements are the National Student Federation of America, founded in 1925, the American Student Union founded in 1935, and the Christian Youth Council of North America which since 1934 represents "Christian youth building a new world." The American Student Union has introduced a new form of "strike" and was responsible in April 1937 for the peace "strike" which united about one million students in protest against war.

The youth movement in the United States has emphasized more and more concrete problems of the adjustment of youth to changing economic and social conditions. Educational aid, vocational training, work programs, social legislation, leisure-time opportunities are some of the problems envisaged. The Government has institutionalized certain attempts to solve some of these problems. The National Youth Administration assisted students in higher education, gave occasional training and guidance, and employed in April 1937 about 192,000 young people on varied work projects. The Civilian Conservation Corps has been an interesting adaptation of the labour service idea to American conditions. On June 28, 1937, the CCC was extended by Congress for three years as part of a training program for youth, after President Roosevelt had recommended its being made a permanent agency.

**BIBLIOGRAPHY.**—Hertha Siemering, *Die Deutschen Jugendverbaende* (Berlin 1931); article YOUTH MOVEMENTS in *Encyclopaedia of the Social Sciences*, vol. XV; the *Annals of the American Academy of Political and Social Sciences*, November 1937. (H. Ko.)

**Yugoslavia**, a kingdom of S.E. Europe and member of the League of Nations. Bounded W. by the Adriatic, N.W. by Italy and Austria, N. by Hungary, N.E. by Rumania, E. by Bulgaria, S. by Greece, and S.E. by Albania. Ruler, King Peter II (born 1923), who succeeded on the murder of his father, the late King Alexander I, Oct. 9, 1934. Flag, blue, white, and red, flown horizontally. During his minority the King is represented by a Regency consisting of H.R.H. Prince Paul, M. R. Stanković, and M. I. Perović.

**Area and Population.**—The area is 95,558 square miles. Pop. (1936), 15,174,000. The population in 1921 was 12,017,323. The Serbs and Croats were then given officially as numbering 8,946,884, which probably included some 3,500,000 Croats and nearly half a million Bulgars and "Macedonians": Slovenes, 1,024,761; Germans, 573,472; Magyars, 467,650; Albanians, 441,740. In 1931 the adherents of the Serbian Orthodox Church (Serbs, Bulgars, and Macedonians) numbered 6,785,501; Roman Catholics (Croats, Slovenes, Germans, Magyars, Bunjevaci) 5,217,910; Greek Catholics (Serb and Rumanian) 44,608; Protestants, 231,169; Moslems, 1,561,166; Jews, 63,405. Education is compulsory and State controlled.

The chief towns, with their populations, are: Belgrade (238,-

775), Zagreb (185,581), Subotica (100,058), Sarajevo (78,123), Skoplie (68,616), Novi Sad (63,985), and Ljubljana (59,765).

**History.**—The late King Alexander abolished the old historic divisions of which Yugoslavia had been composed (Serbia, Croatia, Slovenia, Bosnia, and Herzegovina, Dalmatia, Montenegro, with the Voivodina and Macedonia), and organized the country into Banovinas named after the chief rivers (Dravska, Savska, Vrbaska, Primorska, Drinska, Zetska, Dunavska, Moravska, Vardarska, with the capital city, Belgrade). He also abolished the former Constitution and political parties. In 1931 a new Constitution was introduced, vesting legislative power in the King, the Senate, and the Chamber of Deputies. At first only a single Government party was allowed to exist. An opposition is now permitted, but within very restricted limits, and regional or confessional parties are still prohibited. There is much opposition to this system, led by the Croats. In 1937, although the principles were maintained, the system was slightly relaxed, and the premier Dr. Stoyadinović, held various conversations with M. Maček, the Croat leader. On Sept. 15 the leaders of the three chief Serbian "shadow parties" (Radicals, Democrats, and Agrarians) met at Zagreb and reached an agreement with M. Maček's Croat Peasant party to collaborate in working for free elections under a Cabinet of National Concentration for a Constituent Assembly to adopt a new Constitution. They urged the Regency to appoint a cabinet of "the parties enjoying the confidence of the people." A minor reconstruction of the cabinet followed; but the internal question is clearly still far from solution.

Much agitation was caused by the Government's bill for a Concordat with the Holy See. The Holy Synod of the Orthodox Church protested violently against the alleged privileged position destined for the Roman Catholic Church, and excommunicated the members of the Government and Deputies voting for the bill. There was severe rioting. To make things worse, the head of the Serbian Orthodox Church, the Patriarch Varnava, died at the height of the excitement, and was refused a State funeral. The House of Deputies passed the bill by 167 votes to 127 (July 19), but the Government subsequently withdrew the bill.

Yugoslavia greatly strengthened her international situation during 1937. The Treaty of Friendship with Bulgaria, signed on Jan. 24, secured her eastern flank, and inaugurated an era of genuine good feeling. On March 26, a political and a commercial treaty were signed with Italy. The two countries undertook to respect their common frontiers on land and in the Adriatic. If either were attacked without provocation by one or more Powers, the other would abstain from action calculated to help the aggressor. Each would inform the other of measures taken to safeguard themselves in international crises. They agreed not to resort to war as an instrument of their national policies, and to settle their differences by peaceful means. They would not tolerate on their territories activities directed against each other's territorial integrity or political independence, or calculated to disturb their existing relations. It was understood that they exchanged assurances to respect the integrity of Albania, and not to seek exclusive advantages in that country. Under the trade agreement, Yugoslavia got increased exports to Italy, participation in the benefits of the Rome protocols, and an active trade balance with Italy.

While remaining faithful to the Little Entente and Balkan Entente, Yugoslavia also greatly improved her relations with Hungary. She was visited in turn by German and French statesmen. Opinion in the country seemed much divided on the advantages or otherwise of a close approach to the "Rome-Berlin axis," and no further commitments appear to have been undertaken.

**Trade, Communications, Finance.**—The basis of Yugoslavia's economy remains her agriculture. Maize, wheat, and fruit (especially plums) are largely cultivated. Industry grows slowly; but mining, especially of coal, iron, copper ore, and lead, is becoming important. Imports during 1936 were valued at 4,077 million dinars, and exports at 4,376 million dinars. The figures, both for imports and exports, have risen steadily during the last five years. The balance of trade has been active since 1932. The chief imports come from Germany, followed by Czechoslovakia, Austria, Great Britain, and the United States. Exports go to Germany, Austria, Czechoslovakia, Great Britain, and Italy. The currency is the dinar, nominally equal to 1.7612 gold cents. In 1936 this averaged 77.2% of its nominal value. The budget estimates for 1936-37 were balanced at 10,323.5 million dinars, and for 1937-38 at 10,949 million dinars.

**Defence.**—Military service is compulsory. The army budgetary effectives in 1936-37 numbered 8,969 officers and 107,850 other ranks. The strength in mobilization was stated in 1937 to be well over 1,000,000 men. There is a small navy and an effective air force. (See also BALKAN ENTENTE; LITTLE ENTENTE.)

**BIBLIOGRAPHY.**—*Annuaire Statistique* (Belgrade, annual); S. T. Palmerson, *Yugoslavia* (London, 1936). (C. A. M.)

**Yukon Territory,** the most westerly of the northern territories of Canada, was created a separate territory in June 1898, by Act of Parliament (the Yukon Act). It has a total area of 207,076 sq.mi., and a population of 4,000 (estimate, Dominion Bureau of Statistics, 1935). At the height of the gold mining boom (1901) the population was 27,219. The seat of government is Dawson. By amending legislation provision has been made for a local Government composed of a chief executive, the controller, and an elective legislative council of these members with a three year tenure of office. The controller administers the Government of the territory under instructions from the governor-general-in-council.

Mining is the chief industry, closely followed by trapping, and some fishing. In 1936 the Yukon (together with the North-west territories) produced 50,344 fine ounces of gold, 1,053,733 of silver, and over 40,000 fur pelts. On Oct. 25, 1937 Mr. T. D. Pattullo, premier of British Columbia announced his intention of obtaining the permission of the Dominion Government to extend the boundaries of the province to include the rich resources of the Yukon. The residents have objected, but the decision, when it is made, rests entirely with the Dominion Government.

(J. T. C.)

**Zachrisson, Robert Eugene** (1880-1937), Swedish professor of English. He became professor of English at Upsala university in 1921, and is best known as the inventor in 1930 of "Anglic" or "English in eezy speling," an attempt to overcome the obstacle put by its illogical spelling in the way of English becoming a widely international language. He published many works on English literary and linguistic subjects, such as Shakespearian pronunciation, and modern English philosophy as reflected in literature. He died at Ronneby, South Sweden, in July 1937.

**Zanzibar.** A British protectorate, comprising the islands of Zanzibar, Pemba, and adjacent small islands off the coast of Tanganyika territory. It is ruled by the sultan, H. H. Seyyid Sir Khalifa bin Harub, aided by a British resident, J. Hathorn Hall, C.M.G., D.S.O. The capital is the City of Zanzibar. The sultan was taken ill and removed to the hospital after the opening of the legislature on Dec. 14, 1937.

Zanzibar has an area of 640 sq.mi., and a population of 137,-

741. Pemba, 25mi. to the north, has area 380 sq.mi., and population 97,687. The religion is Mohammedan.

**Trade and Communications.**—There is a weekly mail and a twice weekly passenger air service. The chief export is cloves (23,036,971lbs. exported in 1936). The Government's attempt to limit Indian middlemen's profits in the clove industry led to an Indian boycott of Zanzibar cloves, and a drop in the receipts from the clove export duty to £30,000. It was stated in July 1937, that an agreement in this matter had been reached with the Indian Government. Copra was exported to the value of £144,347. Exports and imports for 1936 amounted to £1,037,000 and £871,000, respectively. East African Currency Board notes and coin became legal tender from Jan. 1, 1936, replacing the rupee. Taxation is by hut tax and estate and stamp duties. Revenue and expenditure for 1936 were £476,000 and £446,000 respectively.

**Zeppelins:** see AVIATION, CIVIL: *Airships*.

**Zinc.** Of the current world zinc output, one-half of the producing countries account for 90% of the total, and the other half for 10%. The details for the major countries are shown in the accompanying table.

World Production of Zinc  
(In thousands of metric tons)

	1929	1932	1934	1935	1936
Australia . . . . .	50.8	53.7	54.3	67.9	70.6
Belgium . . . . .	197.9	96.3	174.9	181.7	197.7
Canada . . . . .	78.1	78.2	122.4	135.3	137.6
France . . . . .	91.6	49.3	51.2	51.5	53.6
Germany . . . . .	102.0	42.0	72.9	124.2	136.4
Norway . . . . .	6.4	40.1	45.5	46.1	45.5
Poland . . . . .	160.0	85.0	93.0	85.0	95.4
U.S.S.R. . . . .	3.4	13.7	27.2	46.2	66.0
United States . . . .	573.0	193.7	332.9	391.5	474.6
United Kingdom . . .	59.2	27.3	52.0	61.4	61.8
World Total . . . .	1,472.8	789.9	1,183.9	1,348.6	1,497.1
Ex U.S. . . . .	899.8	596.2	851.1	957.2	1,022.5

A depression decline of 46% in world output has been completely regained, with 1936 slightly surpassing 1929 in total output, but the trend has differed considerably in different countries; the United States production declined by 64%, against only 34% for the rest of the world and had recovered in 1936 to only 83% of the 1929 high, while other production had almost regained its former level by 1934, and by 1936 had surpassed it by 14%. The chief factor contributing to this was the increased outputs in Australia, Canada, Germany, Norway, and the Soviet Union, and a smaller gain in the United Kingdom, although these were offset partially by declines in France and Poland; among the minor producers the gains and losses roughly balanced. World production during the first nine months of 1937 was at the rate of 1,696,000 tons, an increase of 13% over 1936; Canadian production increased about 10% over 1936, to 165,000 tons; and the United States about 12%, to about 535,000 tons.

For a number of years past, the zinc industry of the United States has been practically self-contained, imports and exports being negligibly small, the former averaging about 2% of production, and the latter even less; but late in 1937 imports increased decidedly, to meet a shortage in supply due largely to the effect of drought on the power supply of the electrolytic plants in the North-west, and will probably total some 35,000-40,000 tons by the end of the year. Australia, Belgium, Canada, Norway and Poland export a large surplus production, but in the case of Belgium, Norway and Poland a large proportion of the output is made from imported ores; France, Germany, Italy, Japan, and the United Kingdom import both ore and metal to

meet a considerable percentage of the demand.

Technological developments in the production of zinc centre largely in the expansion of the recently developed vertical retort smelting and of electrolytic recovery plants, while in utilization the expansion of the applications of die casting and electro-galvanizing are the chief points of interest. Extensions of production capacity were made during 1937 in the electrolytic zinc plants at Kellogg, Idaho; Trail, B.C.; Flin Flon, Man.; and Magdeburg, Germany. (See also METALLURGY.) (G. A. Ro.)

**Zionism**, the movement first set on foot by Theodor Herzl, of Vienna, in 1897, at a World Jewish Congress at Basle for the re-establishment of a Jewish national state in Palestine. After abortive attempts had been made to negotiate with Turkey for a charter for Jewish colonization in Palestine, and the suggestion made by Britain for the establishment of a Jewish colony in East Africa had been refused, Zionism entered the field of practical politics with the "Balfour Declaration" of 1917, in favour of the setting-up of a national home for the Jewish people in the Holy Land on the conclusion of the World War.

The Zionist Organization, presided over by Dr. Chaim Weizmann, is an international body divided into national federations, of which at present about 45 exist in various parts of the world, and holds a biennial congress for the regulation of its affairs. At the 20th congress, held in Zürich from Aug. 3 to 11, 1937, and attended by 500 delegates, the proposals for the partition of Palestine were the principal subject of discussion. The president, while rejecting the proposals for partition put forward by the Royal Commission (see PALESTINE), advised the congress not necessarily to refuse partition in some form as a possible solution of the problem, and the congress, by 300 votes to 158, resolved, while rejecting the scheme, to empower its executive to negotiate with the British Government with a view to clarifying the latter's terms for the establishment of a Jewish state in Palestine. Previous declarations of the desire of the Jewish people to reach a peaceful settlement with the Palestinian Arabs, based on mutual recognition of their respective rights, were reaffirmed by the congress. This decision was supported a few days later by the Jewish Agency for Palestine, an official organization which includes both Zionist and non-Zionist Jews, represents general Jewish interests in the country in negotiations with the British Government, and, through its administrative committee, controls the character of Jewish immigration into Palestine, proportions of labour immigration certificates being assigned to the several Jewish parties at each Zionist congress as a guide to the agency.

At the annual conference of British Zionists held on May 23 strong criticism was expressed of the way in which the Palestinian mandate had been handled by Britain, which, said one speaker, had since 1922 merely interpreted the mandate instead of carrying it out. The increasing Arab opposition to Zionist ideals was strongly voiced at the Pan-Arab congress at Bloudan, Syria, in September, the president declaring that Zionism was a cancer in the body of the Arab countries which must be removed, or it would cause the death of the body, and that unless Britain ceased to support Zionism she must no longer count on Arab support in case of need.

The Zionists' main subjects of complaint against British mandatory administration in Palestine, as expressed at their conferences and in the statements of their leaders, are the failure to introduce a satisfactory system of land distribution; the toleration of subversive activities on the part of Islamic organizations; dilatoriness in dealing with Jewish proposals calling for executive action, and consequent obstruction in the establishment of the national home; delay and inefficiency in the settlement of legal suits and criminal charges; the restriction of the activities of

Jewish municipalities; the display by British officials of pro-Arab tendencies; and general failure to ensure public security. (See also ANTI-SEMITISM; ARABIA.)

**Zoological Gardens.** Recent changes in the design of zoological gardens are notable, and the principle of viewing animals across moats instead of through bars has been extensively put into practice. During 1937 there were many additions and improvements to record.

**United States.**—Recent exhibits at the Zoological park, New York, included a Masai giraffe, a pair of secretary birds, an Asiga gazelle antelope from Russia, and a wattled crane from East Africa. Dr. Raymond Ditmars, curator of mammals and reptiles, went to Panama to visit the Madden dam area to investigate the returning growth of the jungle over land which was cleared, and to speak on vampire bats, to the Panama Natural History Society. Dr. William Beebe returned from his 25th expedition to study the marine life of Bermuda and set out for his 26th expedition. Dr. C. R. Schroeder, veterinarian and pathologist at San Diego, California, was appointed veterinarian of the New York Zoological park, succeeding Dr. Noback, who died in January. The society accepted the management of the "Permanent Wild Life Fund" of \$130,000 left it by Dr. Hornaday, a former director of the park who died in April. The National Zoological park, Washington, opened a new wing to the bird house. The cages have glass fronts and sky-lights to allow the birds direct sunshine. A panorama cage is refrigerated for Arctic birds. The director spent five months in the East Indies collecting strange animals. At the Chicago Zoo, the rare giant panda, Su-Lin, attracted a great deal of amused attention; the air in the lion house is changed every four minutes and oxygen is supplied to the delicate young chimpanzees. Beaver in the Philadelphia zoo have a lake to allow them to build.

**Great Britain and Northern Ireland.**—The maharajah of Bharnagar gave £10,000 towards the construction of a "King George VI Coronation Elephant House" at the Zoological Society's garden in London. Lord Snell opened the studio of animal art, where classes are arranged with animals as models. Mr. D. Seth-Smith gave the first television broadcast with the aid of small animals from the zoo. Over 500,000 people visited Whipnade park during the season. Dudley zoo, the most up-to-date in the country, was opened by Lord Dudley; it included animals from the Oxford zoo, now closed. Lord Salvesen opened a tiger quarry at the Edinburgh zoo in April. At Glasgow a society was formed to organize a zoological park. Chessington zoo opened a new elephant house and a monkey hill. Chester made a new circular enclosure for Malayan bears, built on the open-air principle, and new lion accommodation was opened by Lord Leverhulme. At Liverpool a new zebra paddock was opened, and at the Manchester zoo the old ape-house was turned into a cubs' club for young lions and tigers. At Bristol a male giraffe calf was born and the zoo acquired a young grey kangaroo and wallabies. At Belfast a new ape-house was constructed from the old sick-bay.

**Europe.**—The Copenhagen zoo is replacing the out-of-date housing by modern. Frankfurt received a giant armadillo from South America. Munich opened a new and particularly good ape-house and parrots were placed on stands in front of the elephant pens. At Nuremburg the zoo ground is required for a parade ground and the zoo will be moved out into the country. An interesting experiment is being carried out of breeding back to the extinct wild ox of Europe. The polar bears at Leipzig have diving boards of green plate glass, which give an illusion of ice, with water slipping under. Professor Manteifel, director of the Moscow zoo found that hundreds of small Australian parrots refused to nest until dummy nests were provided. (V. R.)

## Zoology.

A review of the genetics of the lepidoptera has been given by Ford, in the course of which he develops a theory in explanation of the phenomenon known as "industrial melanism"; that is, the supersession in industrial areas of black varieties of lepidoptera for those of other colours. It has previously been imagined that the melanism was due either to selection favouring black mutants, or to the induction of black mutations by the manganese and lead salts which, in such areas, cover the leaves of the food-plants. It is, however, now considered unlikely that melanism can be induced in this way, and Ford suggests that the origin of melanic varieties is due to the selection of genes conferring physiological advantages combined with a black colour. This accounts for the fact that melanic forms show, in general, a higher viability, and suggests that melanic varieties will become established wherever their survival is not directly handicapped by their black colour, and particularly, therefore, in industrial areas. The interest of the phenomenon is thereby shifted from the problem of the origin of melanic varieties to the question why these hardier forms do not supplant their non-melanic relatives throughout the range of the species. The answer appears to be that outside manufacturing areas the melanic forms in spite of their physiological advantages are handicapped by their blackness and kept down by counter-selection for colour.

Great advances in knowledge of the phenomena of reproduction in calcareous sponges have been made by Duboscq and Tuzet. With regard to the origin of the eggs, it seems more than probable that the oögonia are derived from choanocytes which lose their flagella and collars and desert the flagellated chambers for the underlying mesenchyme. The growth of the oöcyte is accomplished with the help of nutritive cells, the "dolly-cell" and the "satellite," which are likewise immigrated choanocytes. The sperm which has made its way into a flagellated chamber enters a choanocyte which then withdraws and carries the sperm to the egg which is then fertilized.

Cleavage leads to the formation of a "stomoblastula": a single-layered blastula with a hole through which yet more immigrated choanocytes constantly pass to feed the embryo. The stomoblastula has four radially situated sense-organs, and its cells develop flagella on their internal surface, projecting into the central cavity. A remarkable event then occurs, which has been overlooked by all previous workers. The stomoblastula literally turns itself inside out, and reverses its surfaces. The flagella are then on the external surface of the embryo, which soon becomes converted into the familiar amphiblastula larva, and swims away. Thus, in addition to the well-known reversal of the layers which takes place during metamorphosis, these sponges undergo a first reversal during the embryonic stage.

A reinvestigation of the process of the gastrulation in vertebrates with heavily-yolked eggs has led Pasteels to conclusions of considerable importance. Gastrulation is the combined result of a number of specific mass-movements of different parts of the blastula: invagination, convergence, and expansion. The time-relations of these movements differ. In the Anamnia, invagination and convergence start in the dorsal region and progressively affect the lateral and ventral regions; expansion occurs at the same time. In reptiles, invagination and convergence take place simultaneously all round the blastopore, but expansion occurs relatively later. In birds, invagination and convergence start in the ventral region and progressively affect the lateral and dorsal regions, and expansion does not begin until invagination has finished. In addition, in birds, there are combined movements of the upper and lower layers of the blastoderm. By assuming variations in these constituent processes of gastrulation, Pasteels is able to interpret

the primitive streak and the retreat of Hensen's node. It is also worth noticing that gastrulation cannot be defined statically in terms of the shapes of gastrulae of different organisms, for there is too much disagreement between them; gastrulation can only be defined kinetically in terms of the above-mentioned mass-movements, the result of whose activities is the shifting into position of the materials of the future internal organs.

The outstanding advances in the study of embryology resulting from Spemann's discovery of the power of a certain region (the "organizer") of amphibian embryos to induce the formation of various essential structures, have been extended to birds and mammals by Waddington. He has succeeded in pressing the analysis of the phenomenon further by distinguishing between "evocation," the process of induction of a structure, say the spinal cord, and "individuation," which is the determination of the regional characters of the structure induced in such a way that they conform to the normal structure of an embryo, for example, the modification of the front end of the spinal cord into a brain. "Individuation" has, so far, been obtained only as the result of the activities of living tissues; "evocation" has, however, been shown to be due to the activity of chemical substances, probably of a sterol nature combined with glycogen and protein. Hartley, Waddington, and Needham have obtained what appear to be examples of evocation without individuation, by subjecting isolated pieces of epidermis to the action of glycogen and its associated substances.

The lateral line organs of aquatic vertebrates have long been objects of interest from many points of view. In development, structure, and innervation, they are closely related to the auditory vesicles. As regards their function, Sand has now been able to show that the lateral line sense organs have the property of spontaneous discharge of impulses, and that these impulses are inhibited or augmented according as fluid flows in one direction or the other through the lateral line canal. It is interesting to recall that, as Loewenstein and Sand have shown, the sense organs of the horizontal semicircular canal of the ear are also spontaneous dischargers of impulses, which are reduced or increased by rotation of the head in the contralateral or ipsilateral directions respectively.

A description of the structure of the Acanthodian fishes is now available, thanks to the work of Watson. These remarkable fishes present a number of features of first-class importance for the interpretation of the evolutionary history of the early vertebrates. The body was covered with bony scales, and both dermal and perichondral bones were present. The bone was of peculiar kind, rarely if ever containing bone-cells. It is interesting to note that in the earliest Acanthodians, while the visceral arches had thin layers of perichondral bone, the brain-case was only cartilaginous. The lateral line canals ran between two rows of scales. The nostrils pointed forwards. In addition to the pectoral and pelvic paired fins, there were numerous pairs of intermediate paired fins, which condition provides strong evidence in favour of the evolution of paired fins from longitudinal fin-folds. The gill-slits were protected by a mandibular operculum; the hyoidean slit was large, and the hyoid arch played no part in the suspension of the jaws. This feature is used by Watson to characterize the group termed by him the *Aphetohyoidea*, containing the *Acanthodii*, *Arthrodira*, *Antiarchi*, and others, and which represents the most primitive grade of Gnathostome vertebrate structure.

# INDEX

The black type entries are article headings and cross references. These do not show page notations because they are to be found in their alphabetical position in the body of the book. The light type headings which are indented under black type article headings refer to articles elsewhere in the text related to the one listed in black type. The other light type headings which are not indented refer to information in the text not given a special article. All the light type headings show page references. All headings whether consisting of a single word or more are treated for the purpose of alphabetization as single complete headings. Names beginning with "Mc" and "M" are alphabetized as "Mac"; "St." is treated as "Saint." All references below show the exact quarter of the page by means of the letters *a*, *b*, *c*, and *d*, signifying respectively the upper and lower halves of the first and second columns.
